

# Cool Applications: CS + Biology (and friends)

Dave Abel

April 20th, 2016

# Schedule

- Wednesday (Today): Randomness, CS + Bio!
- Friday (4/22): What CS to take next? Graphics!
- Monday (4/25): Dave's Research
- Wednesday (4/27): Last Day! Whole Term Recap + Final Review
- March 10th: Writing Assignment Due
- March 15th: Python Project Due
- March 19th: Final Exam, 2pm in LIST 120.

# Yurt, Round Two

- If you want to go, email me with subject “Yurt”
- Specify which time you’d like to go:
  - **5 slots left:** Monday, May 9th from 2pm-3pm
  - **1 slots left:** Tuesday, May 10th from 11am-noon

# Writing Assignment

- Writing Assignment Rubric Released
  - Find a few academic articles or papers that discuss how CS has affected a different **topic** of interest to you.
  - Write a short reflection paper summarizing and analyzing the topic, focusing on the technical explanation and on how computer science concepts are relevant to it.
  - Due May 10th.
  - 800-1200 words (~2 pages)

# Python Project

- Python Project Rubric Released
  - Due May 15th.
  - Stencil Code Released.
  - More than happy to help in office hours, over email.

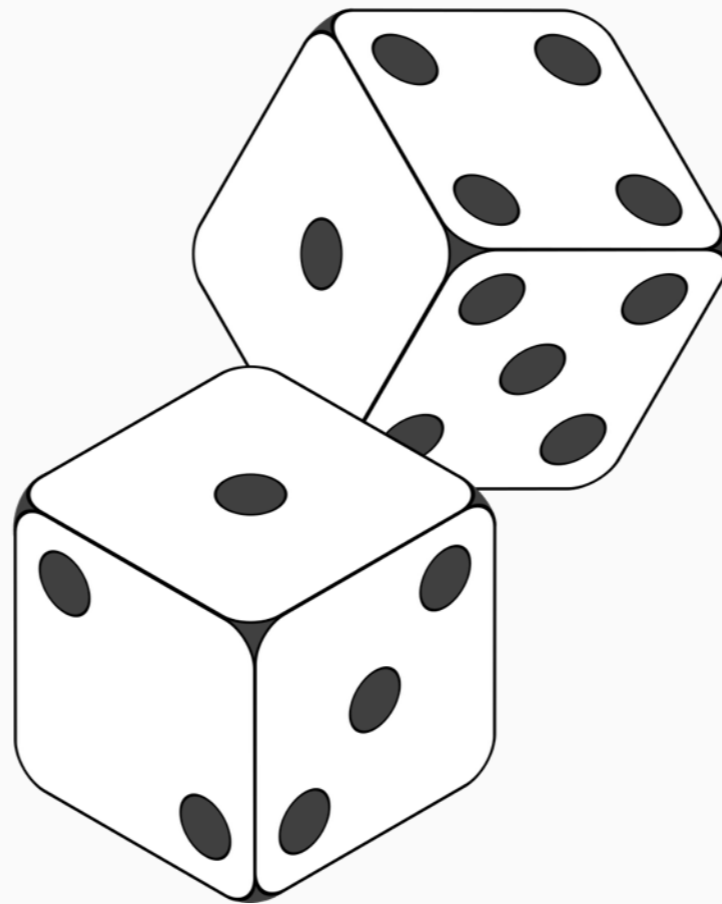

# Other Notes

- No more labs! Don't go to your lab tomorrow.
- No more regular homework (writing assignment is the last homework).
- Final Exam review session will be held closer to reading period.
- My office hours will be changing during reading period.

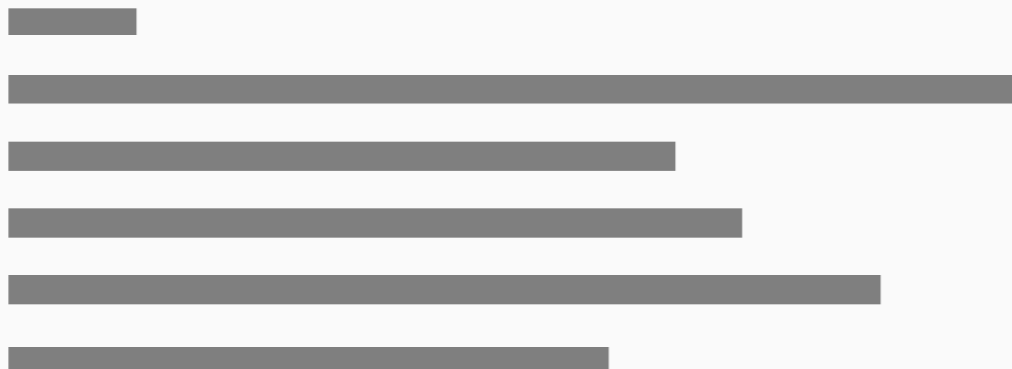

# Randomness

# Randomness

- Earlier notion of randomness from Theory!
- The higher the Kolmogorov complexity, the more random an object is.

# Randomness

- But how about *events*? Really, we want this:

**pick random 1 to 10**

# Randomness

- But how about *events*? Really, we want this:

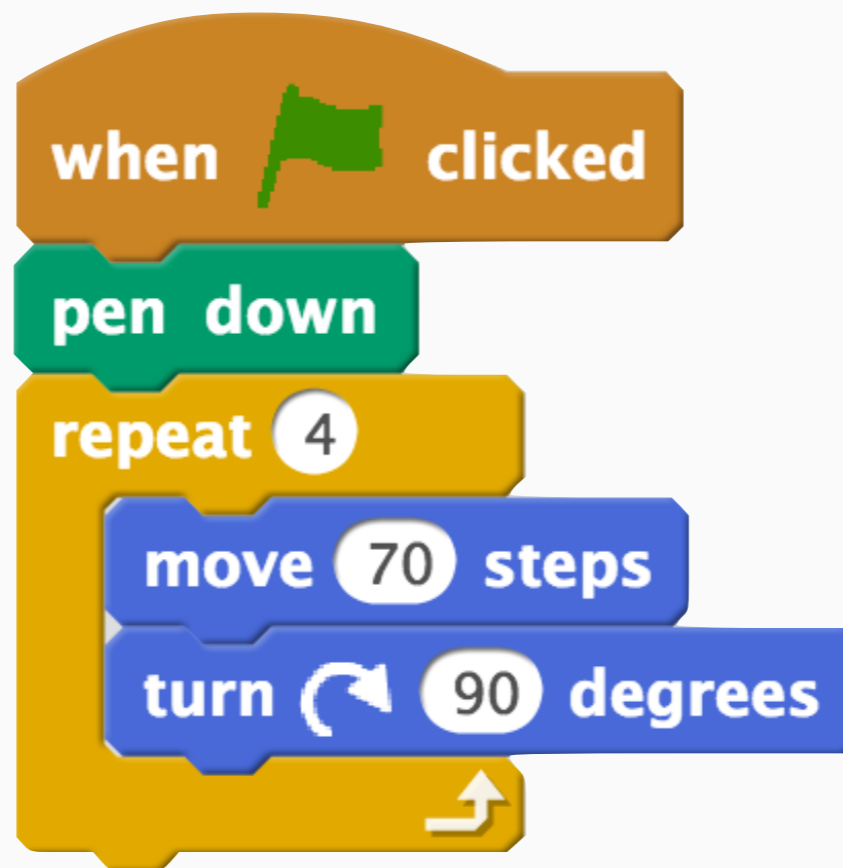

- But suppose we didn't have this block. How could we write a block to carry out random operations?

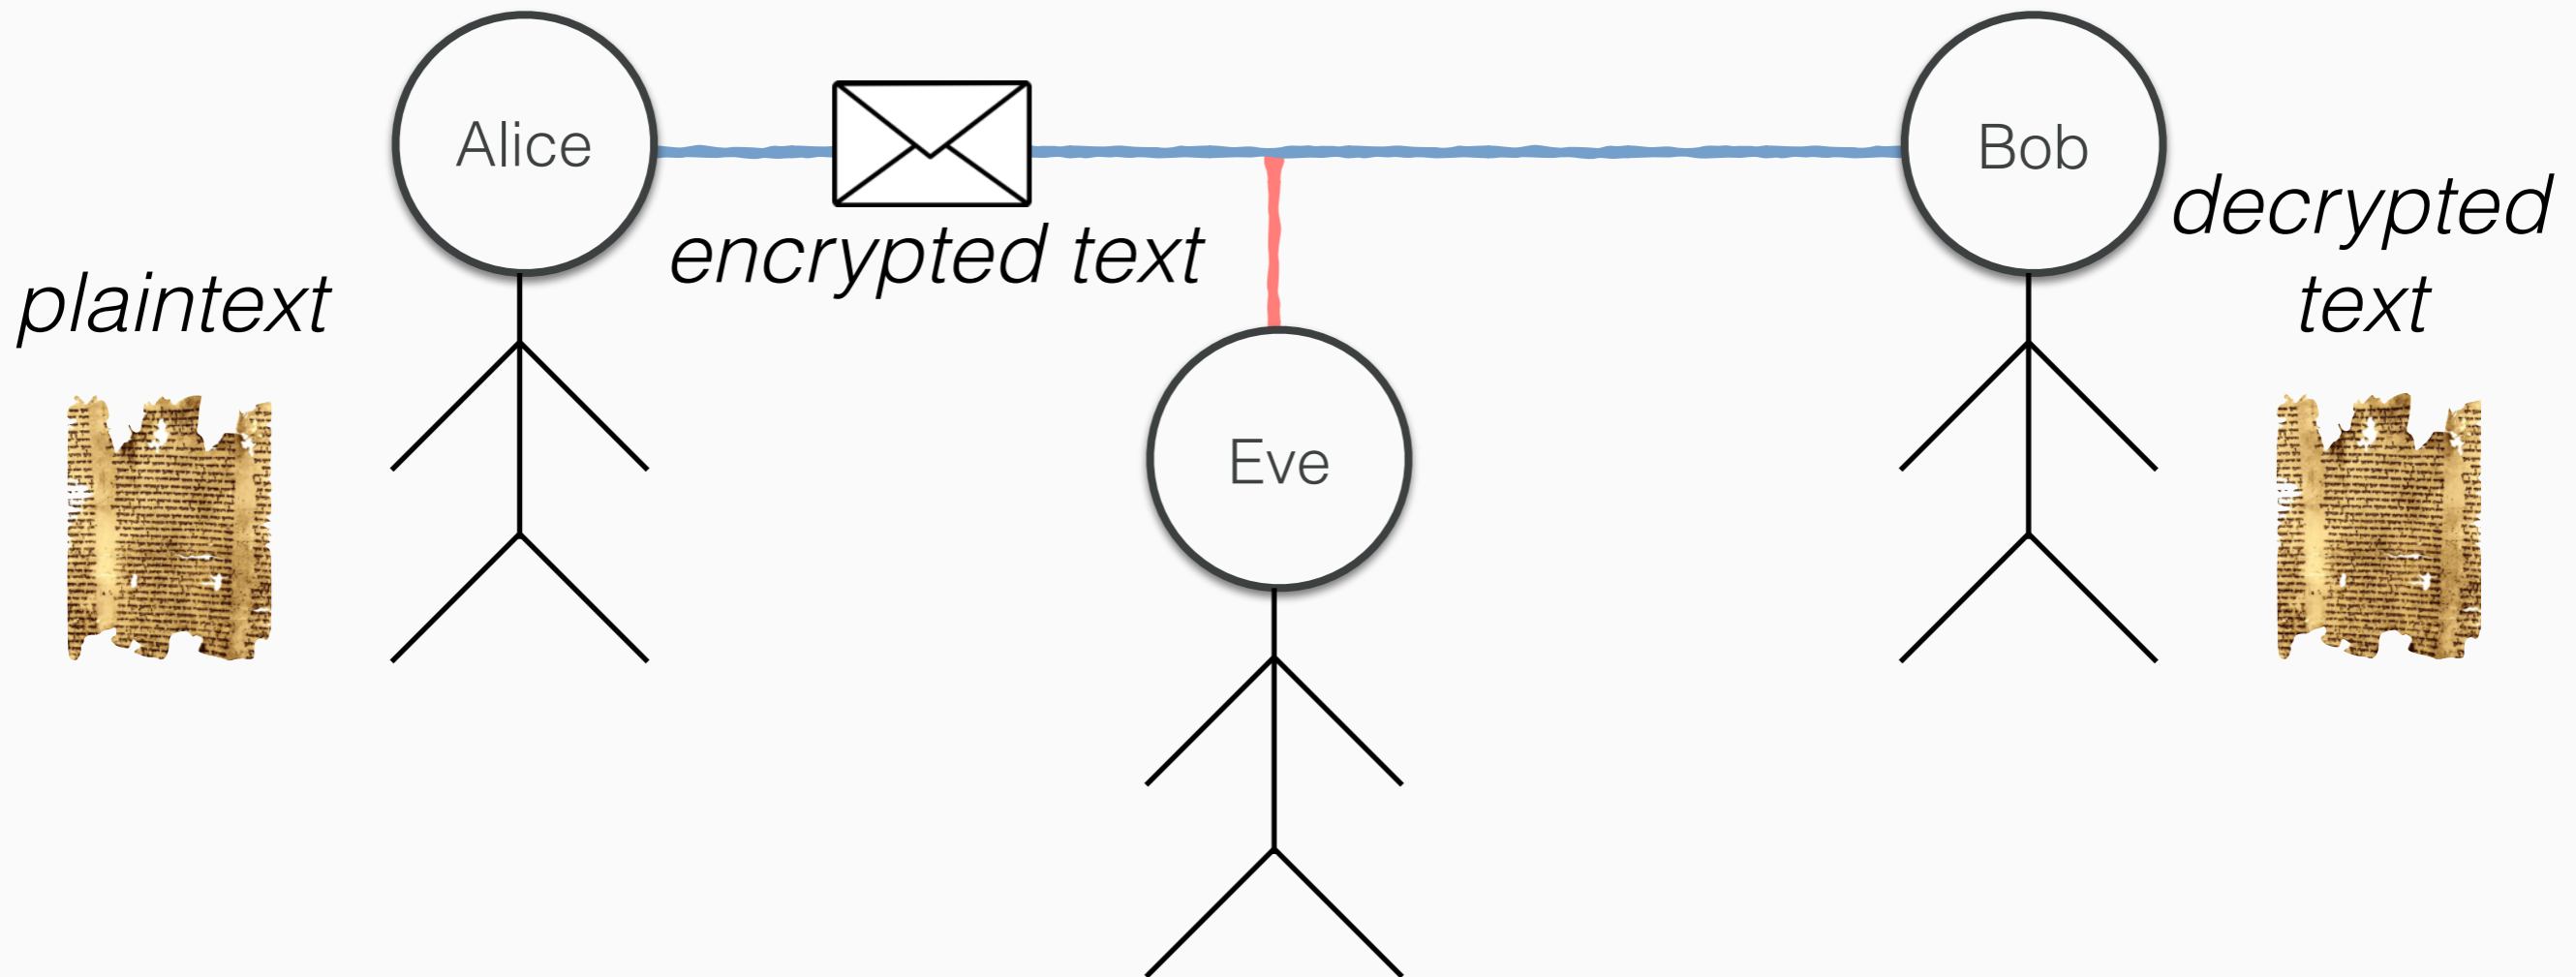

# Randomness

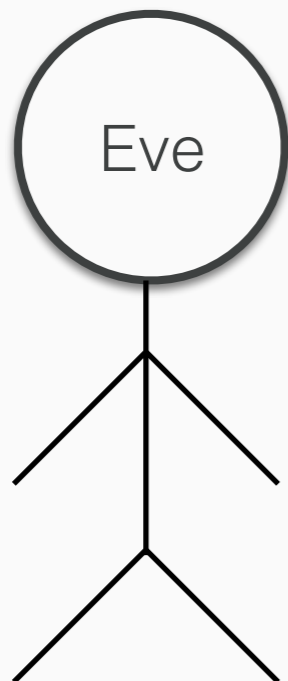

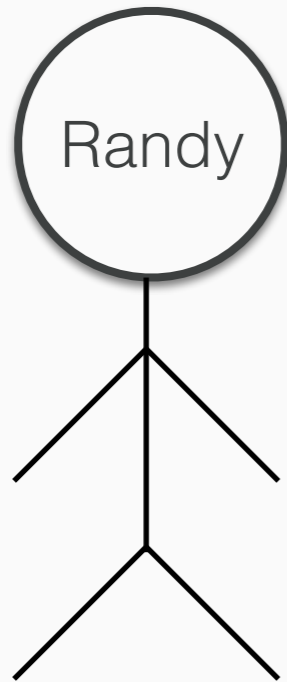

- Everything has been so *deterministic*:

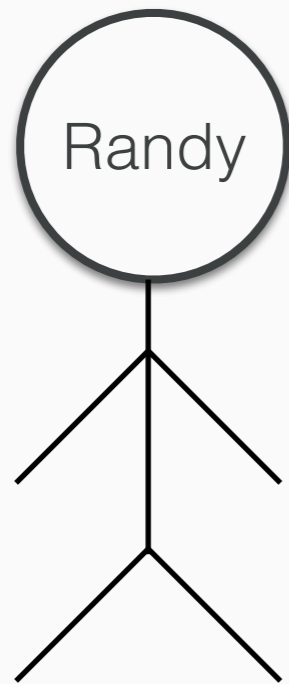

# Randomness & Crypto

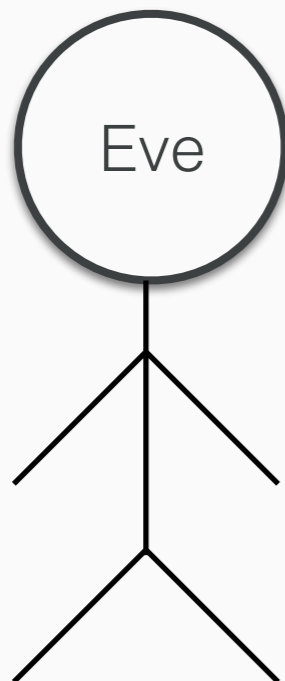

# Randomness & Crypto

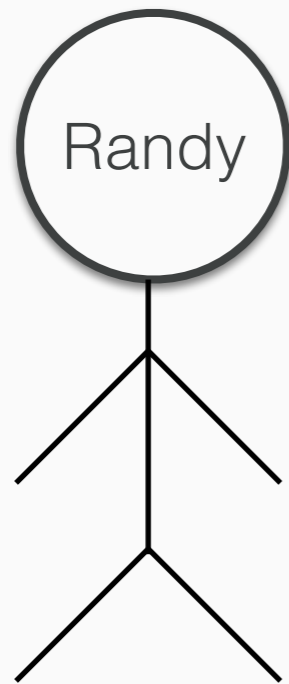

# Randomness & Crypto

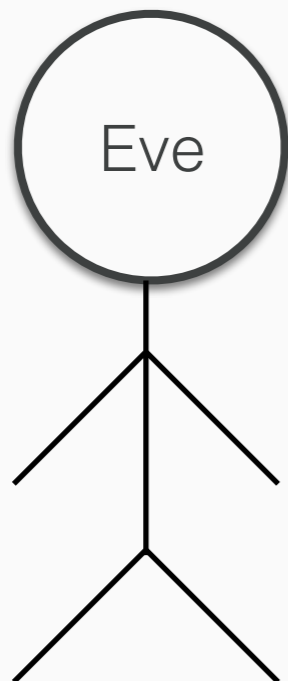

“I have figured out a way to simulate random coins!”

# Randomness & Crypto

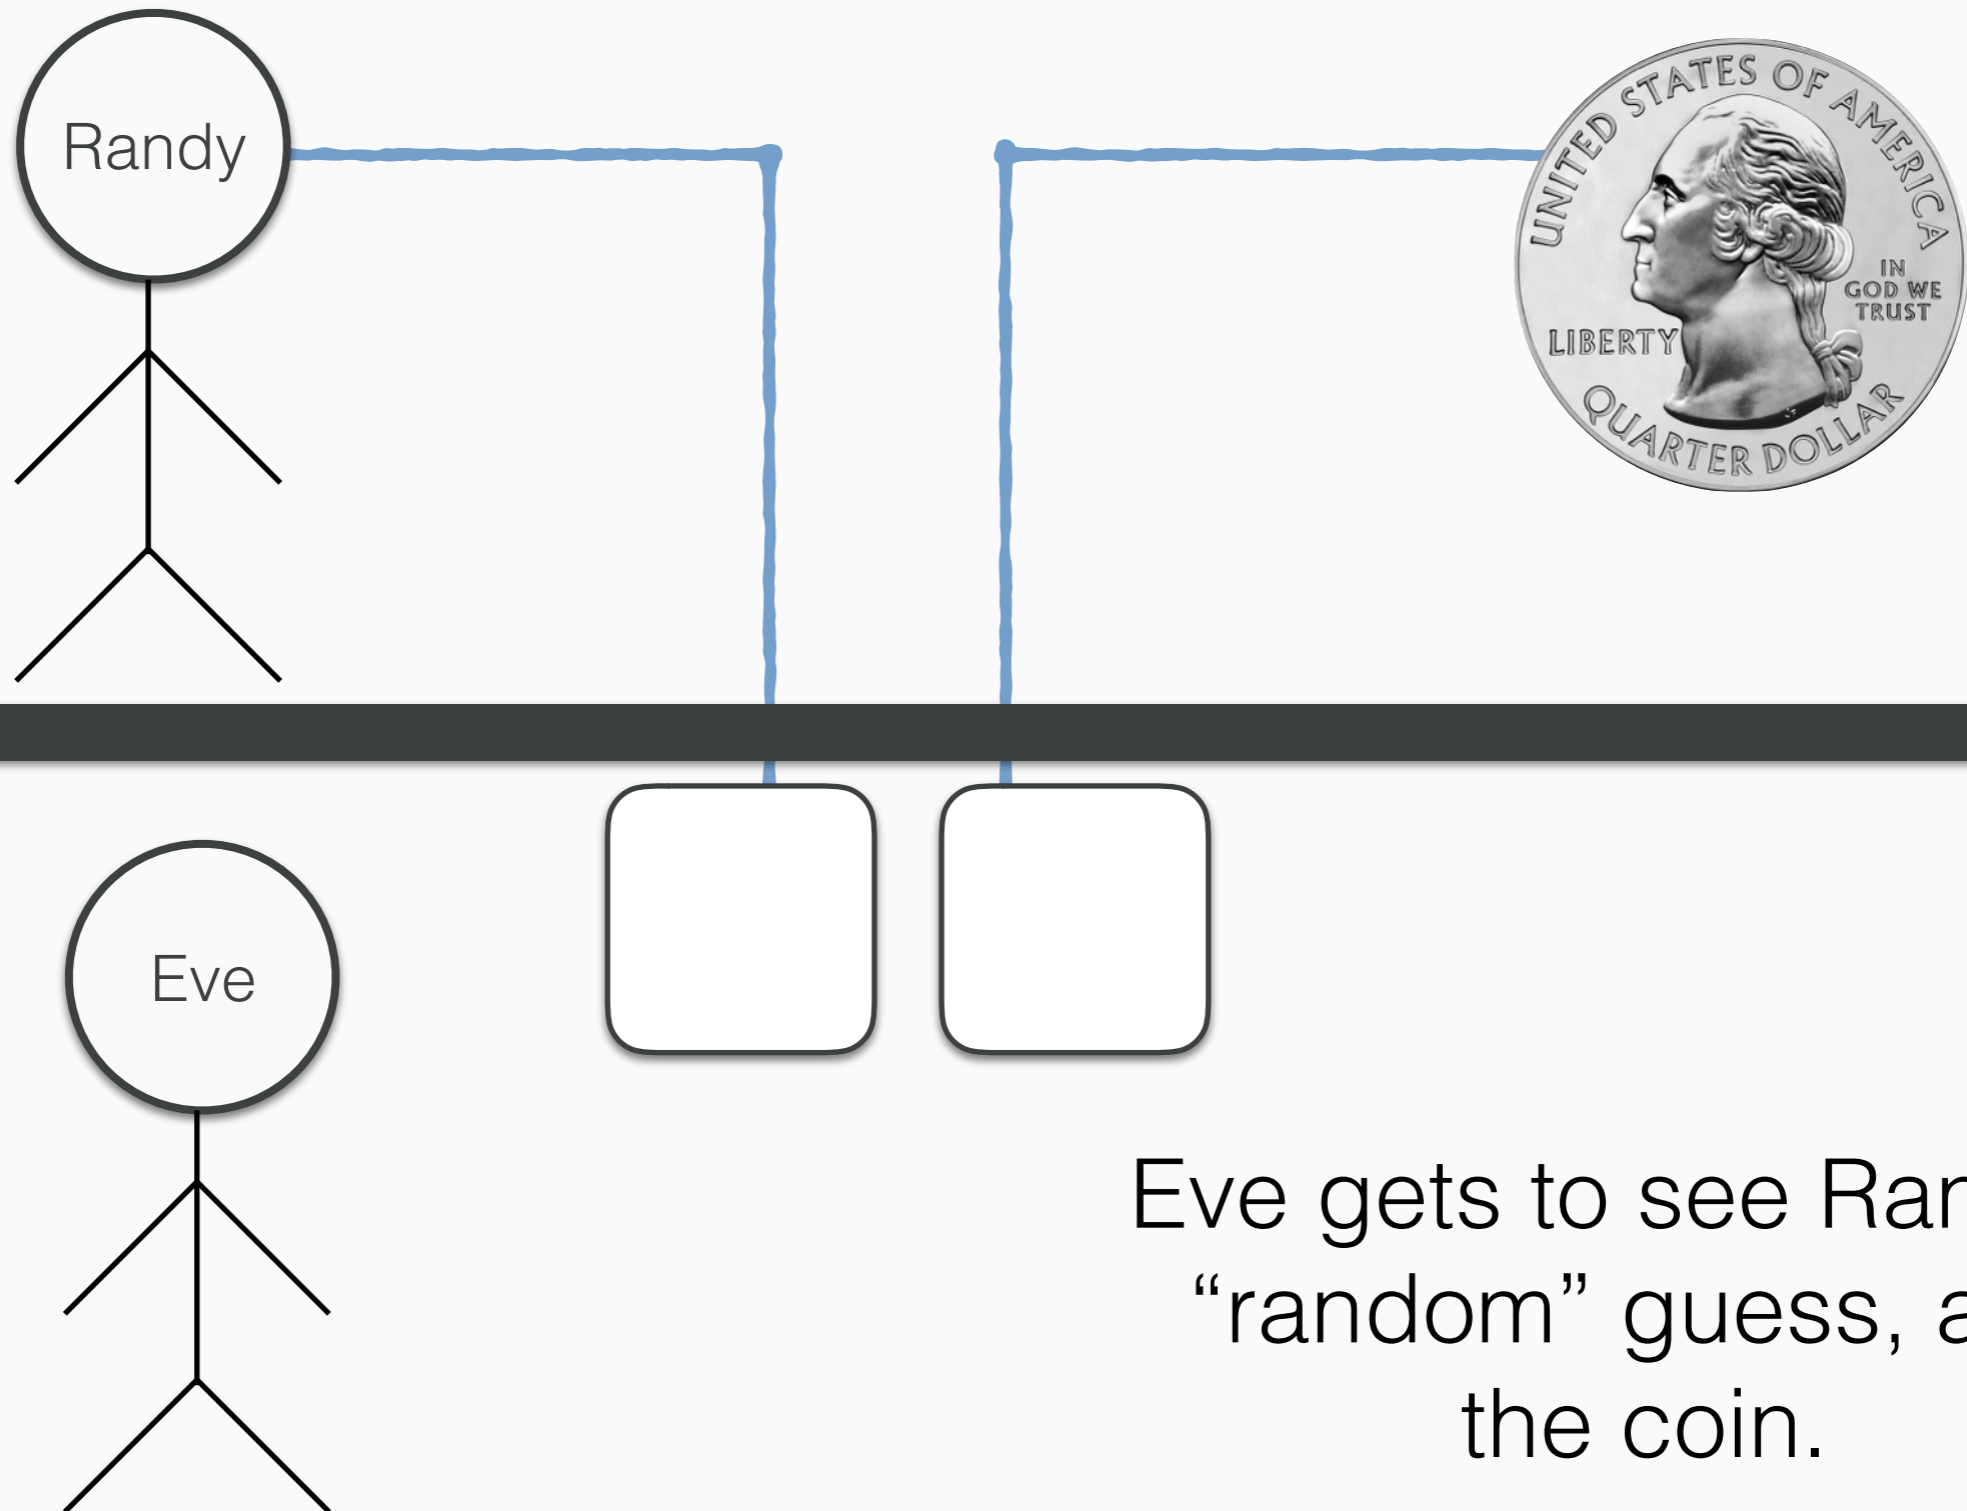

“I have figured out a way to simulate random coins!”

“No way...”

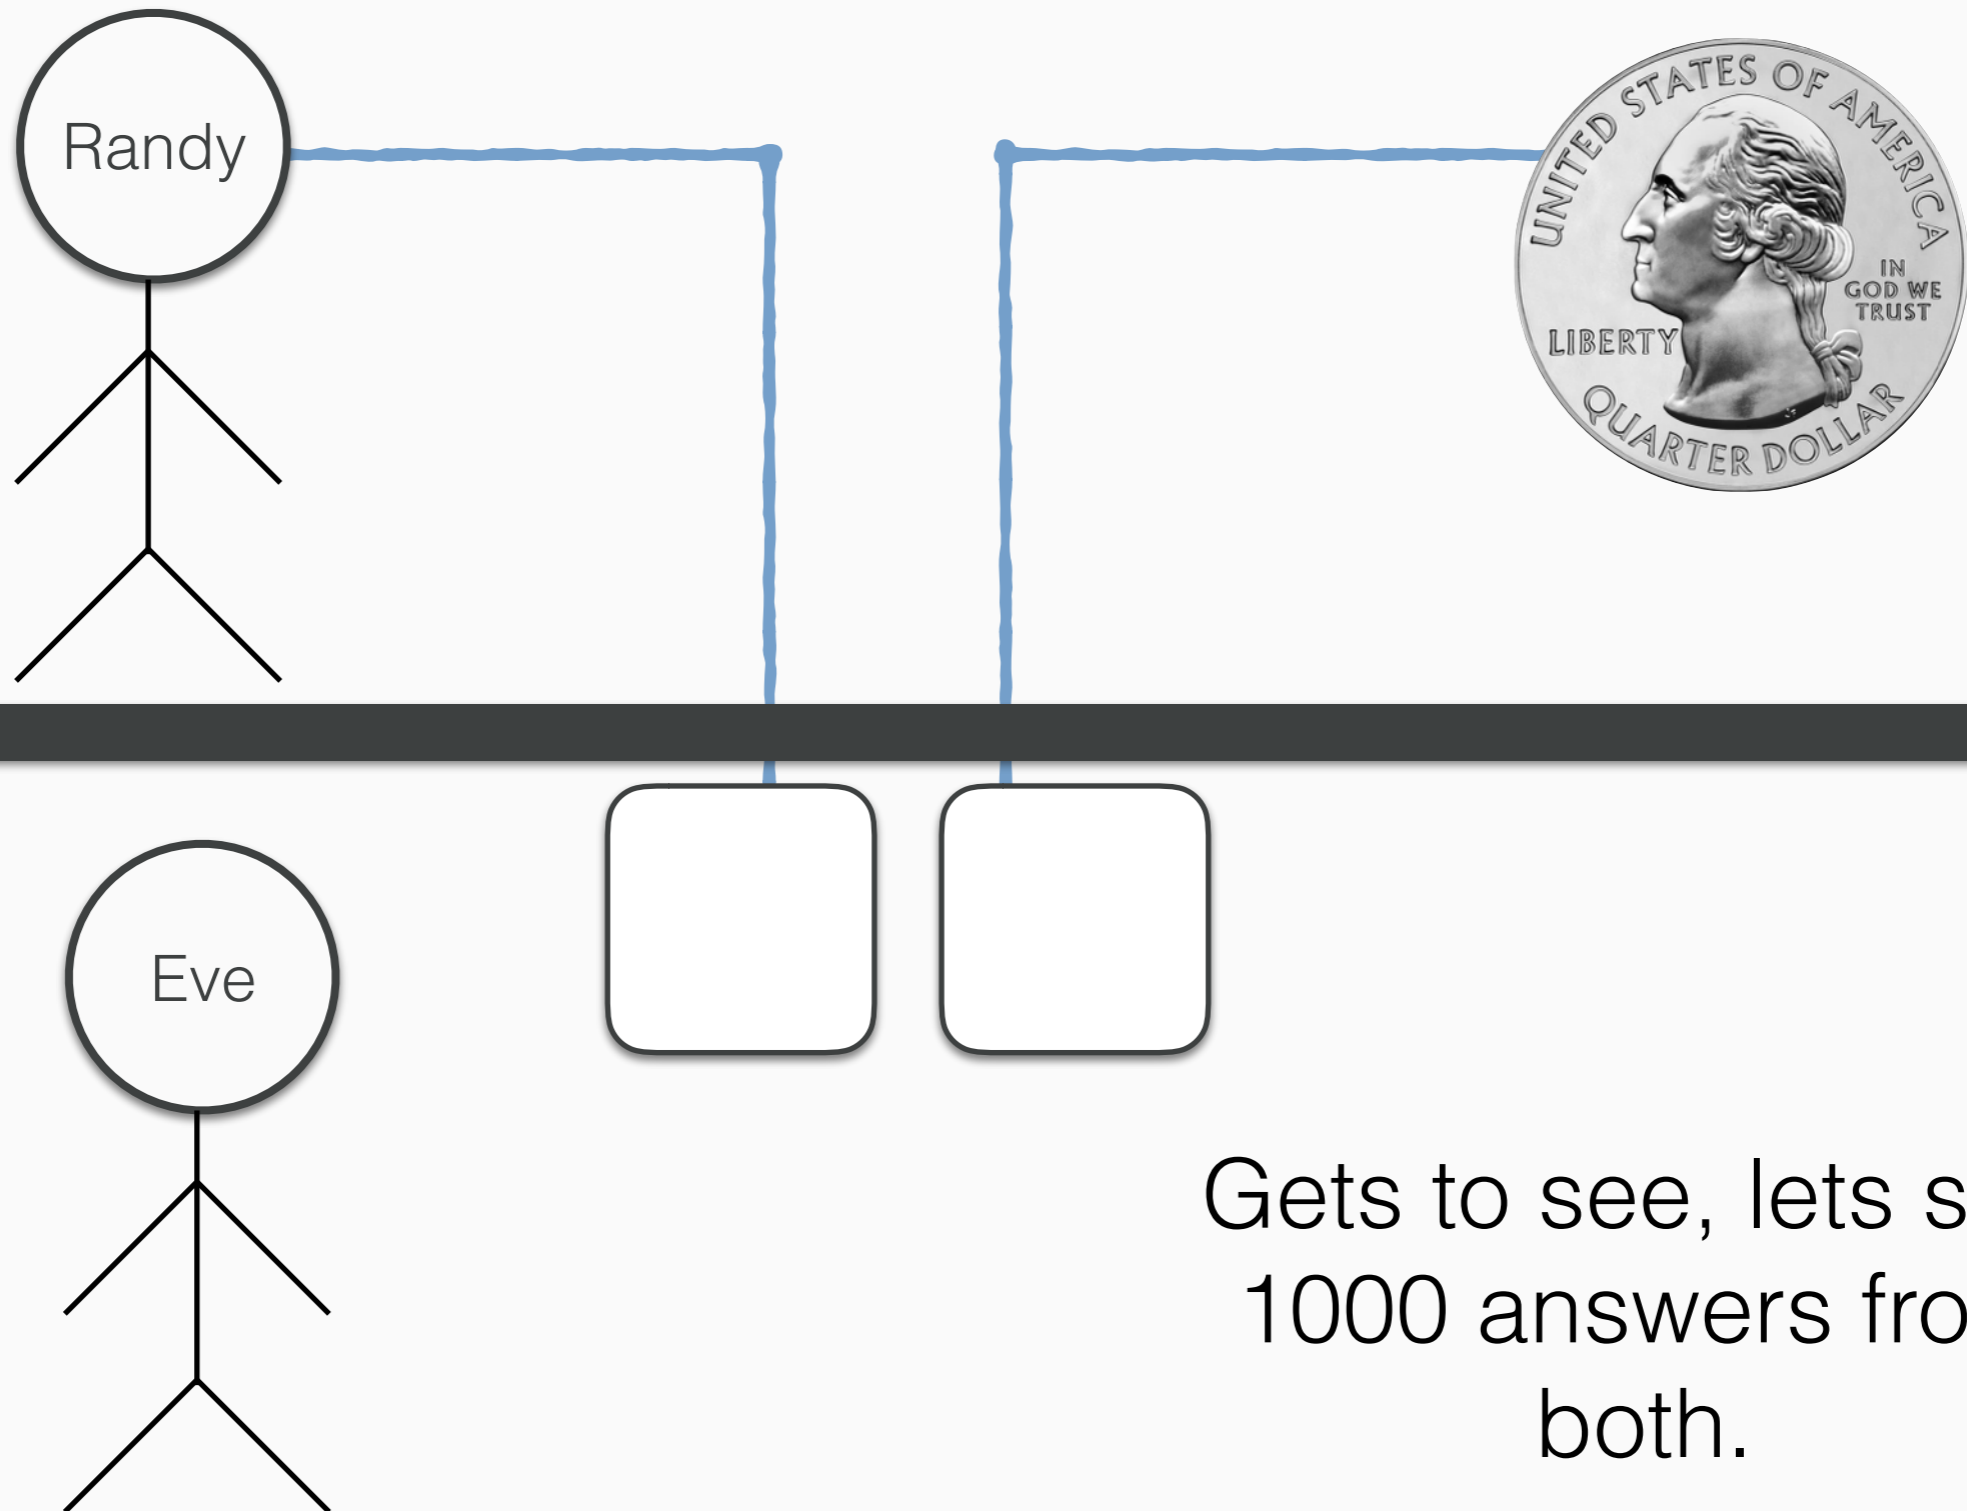

# Randomness & Crypto

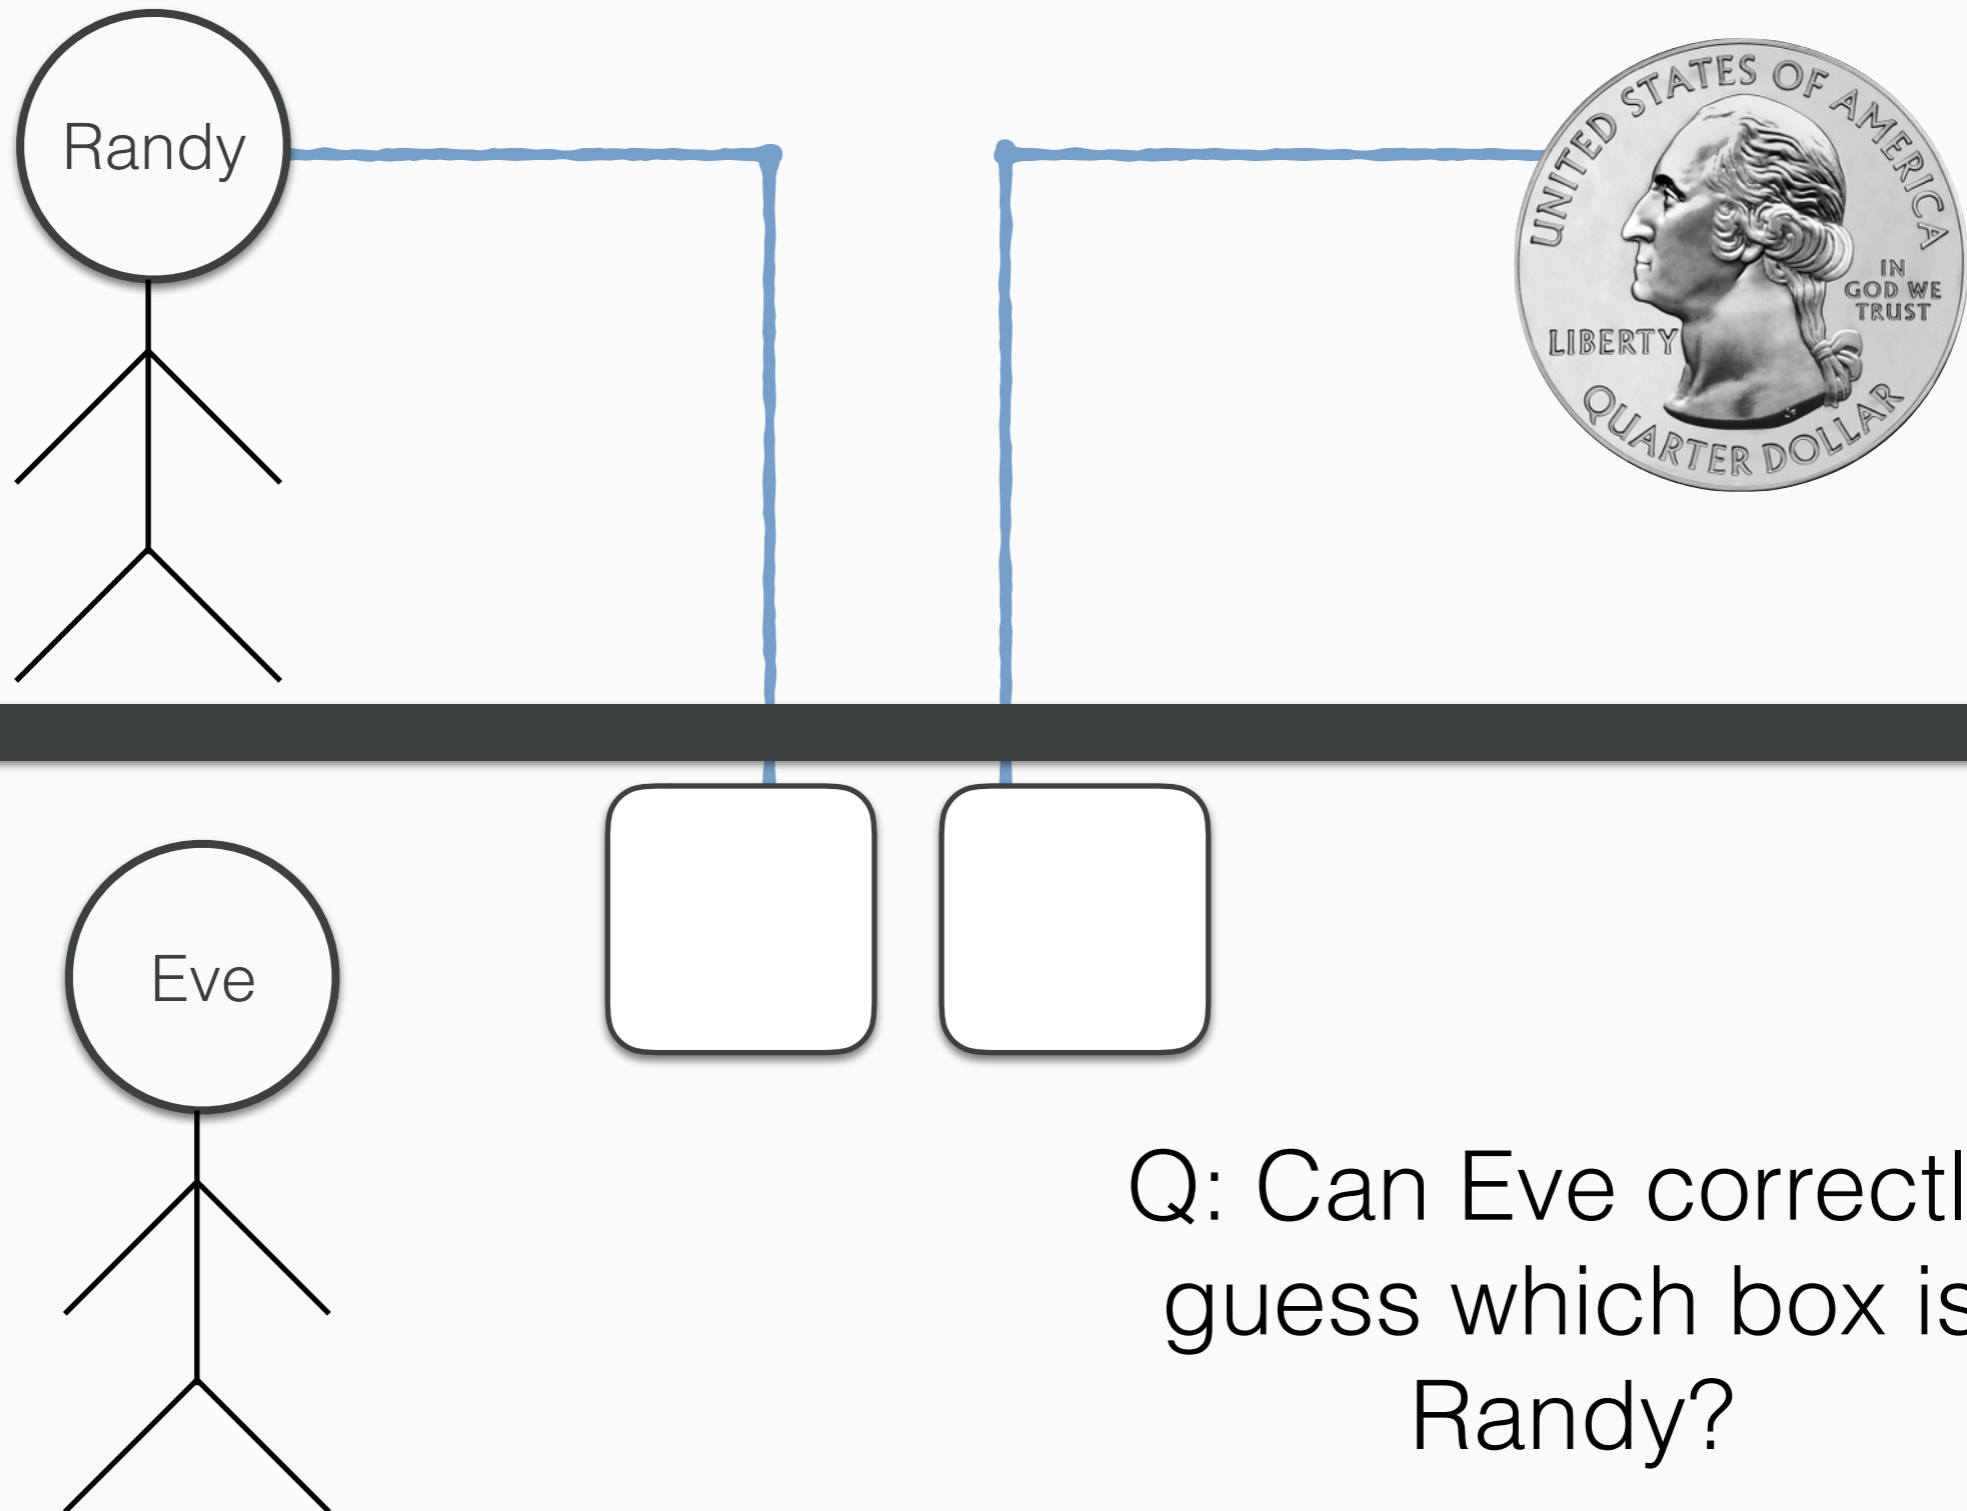

Eve gets to see Randy's  
“random” guess, and  
the coin.

# Randomness & Crypto

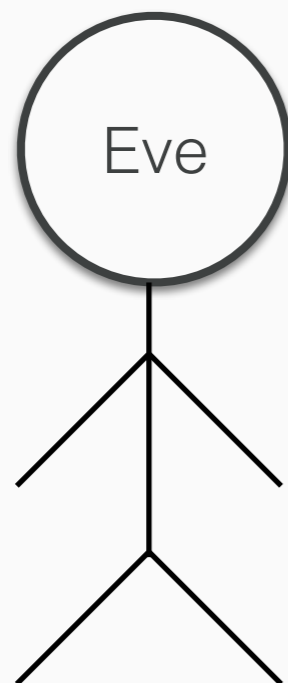

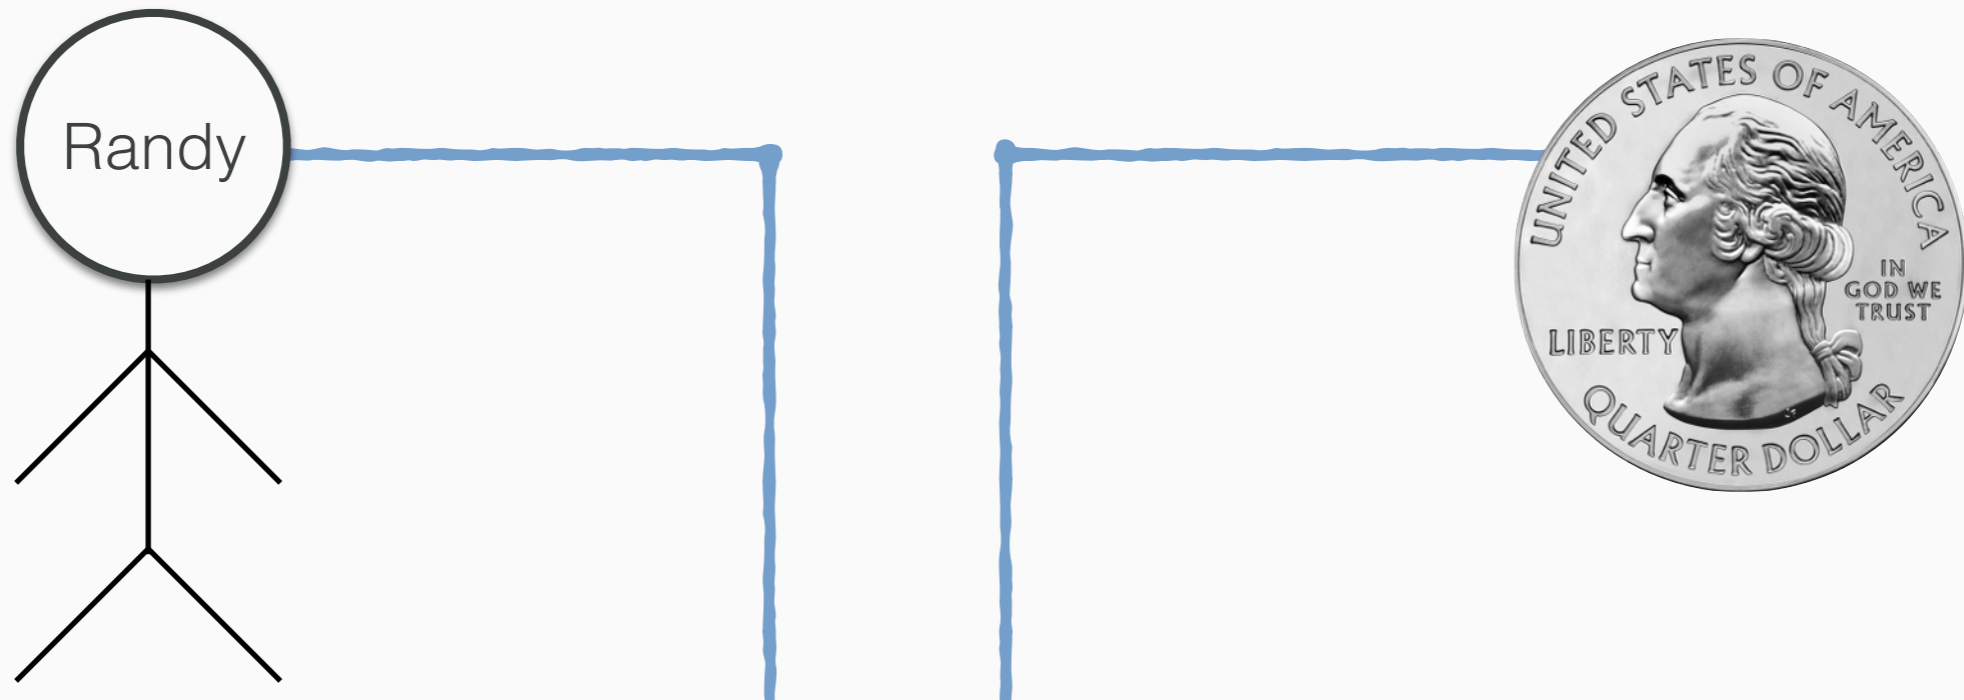

# Randomness & Crypto

Q: Can Eve correctly guess which box is Randy?

# Randomness & Crypto

Q: Can Eve correctly guess which box is Randy?

If Eve can be right more than  $1/2$  the time, Randy isn't Random

# (Psuedo)-Randomness

- **Definition:** A process is *pseudorandom* if an adversary, Eve, cannot distinguish the process from a truly random process!

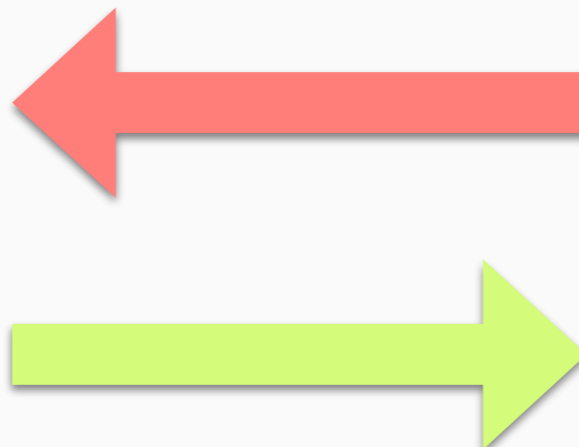

# (Psuedo)-Randomness

- **Definition:** A process is *pseudorandom* if an adversary, Eve, cannot distinguish the process from a truly random process!
- Q: Can humans do this?

# Pseudorandomness

- **Definition:** A process is *pseudorandom* if an adversary, Eve, cannot distinguish the process from a truly random process!
- Q: So how do we achieve this?
- A: One Way Functions!

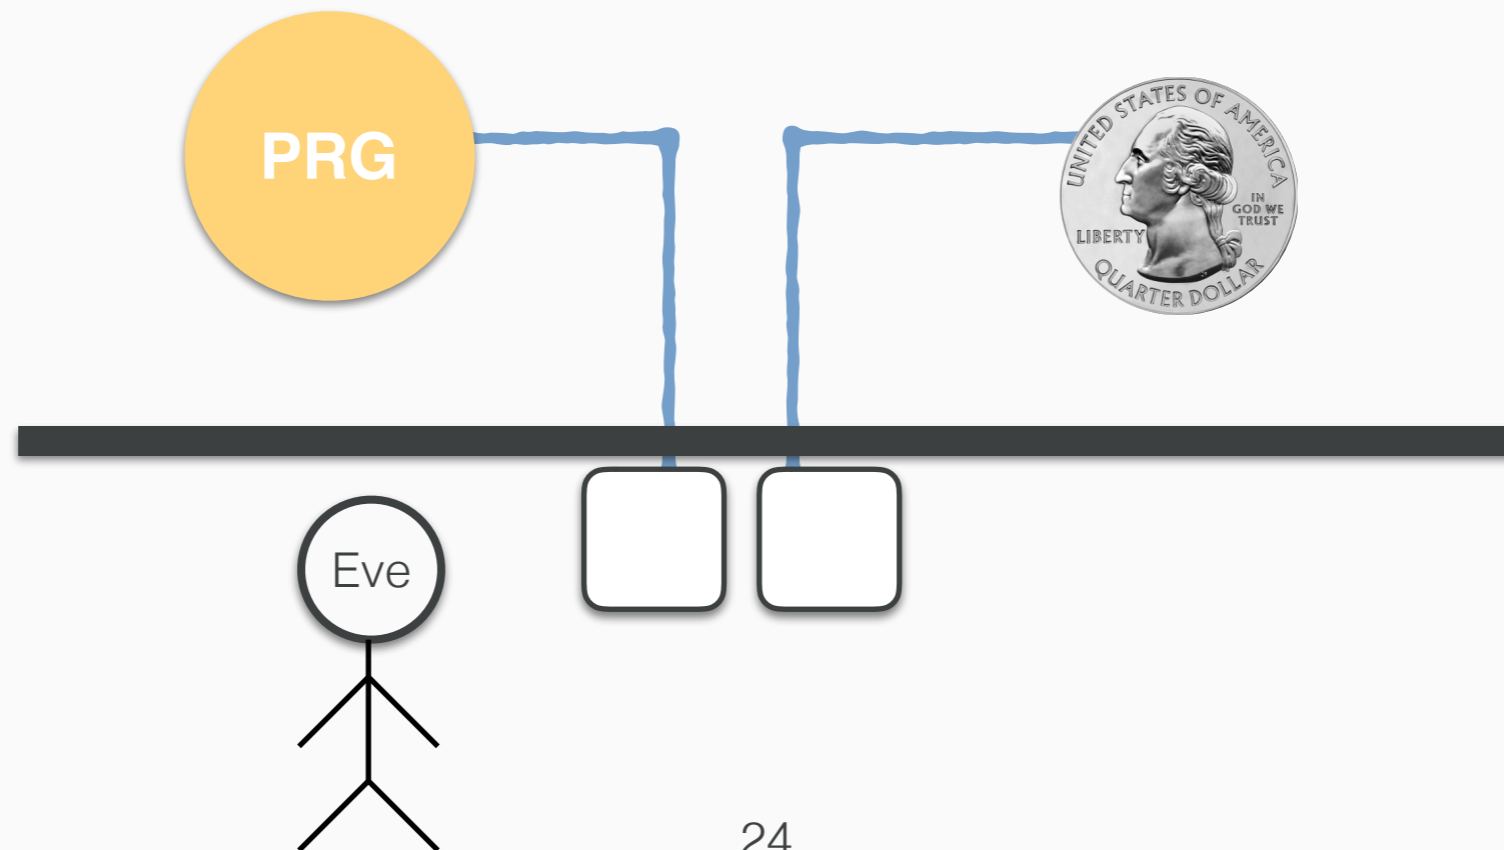

# OWFs as Pseudorandom Generators

- Intuition: If it's easy for you to figure out why something happened, then it's not really random.
- One Way Function: It's hard to figure out the input, given the output.

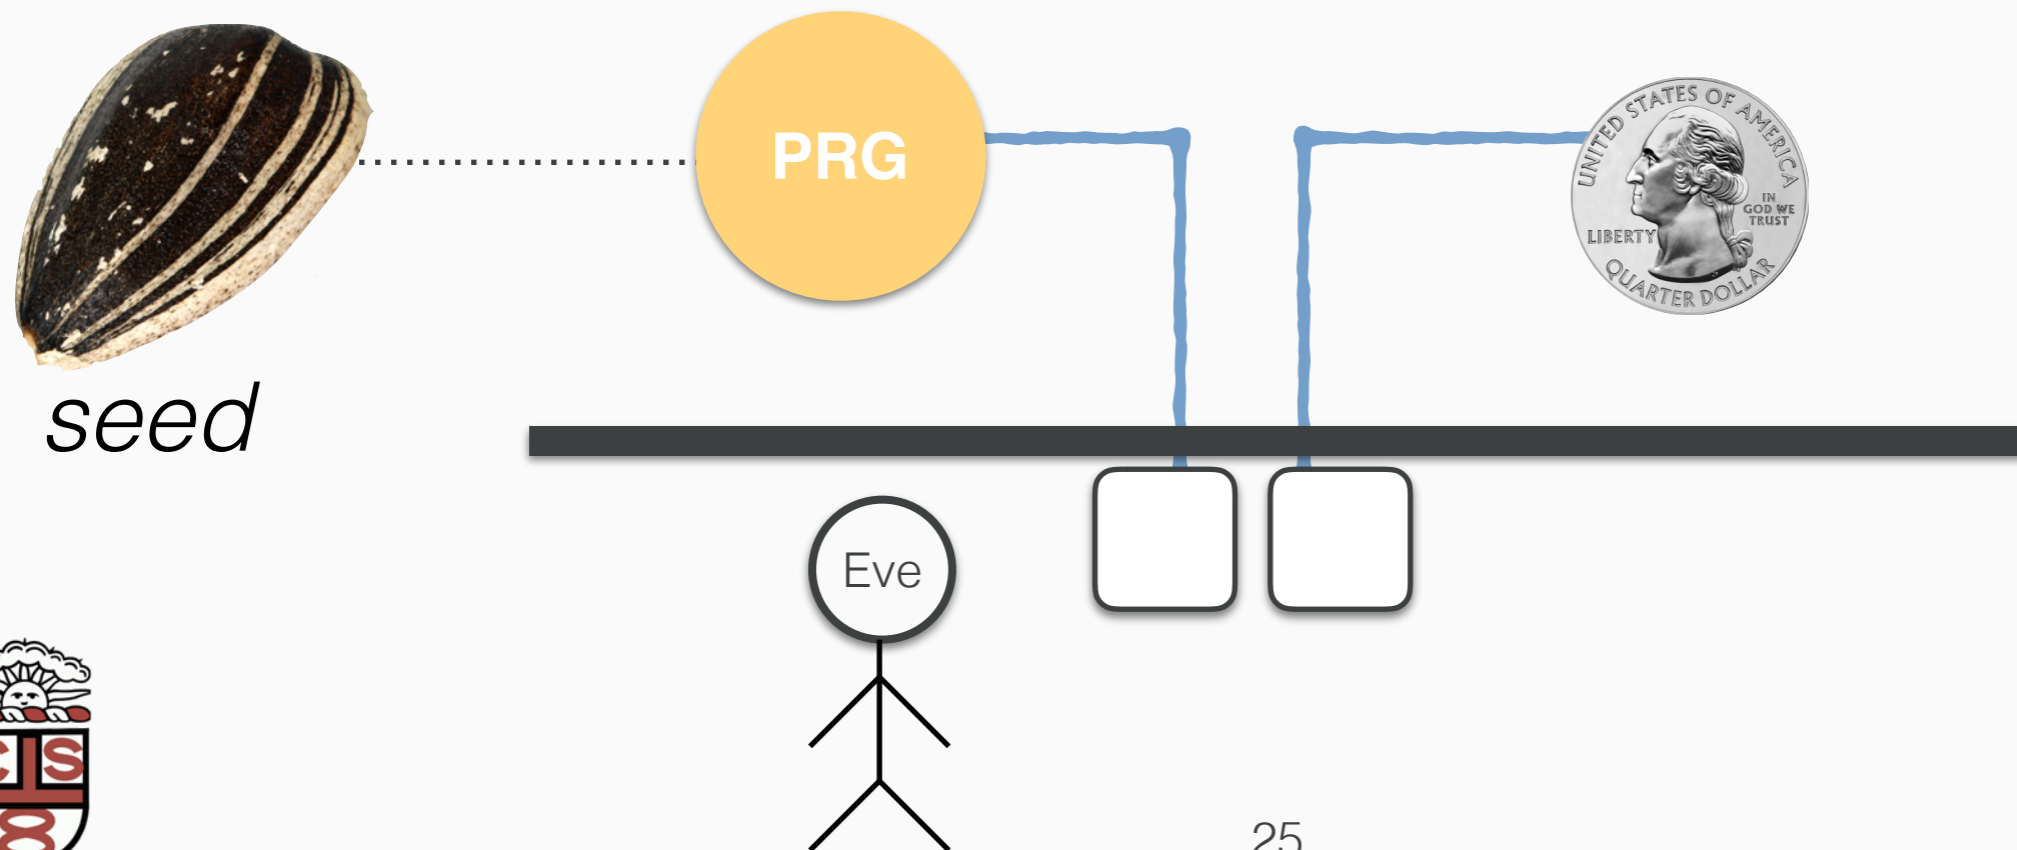

# Why Did I Cheat Before?

- An object that generates pseudorandom numbers is called a PseudoRandom Generator, or PRG

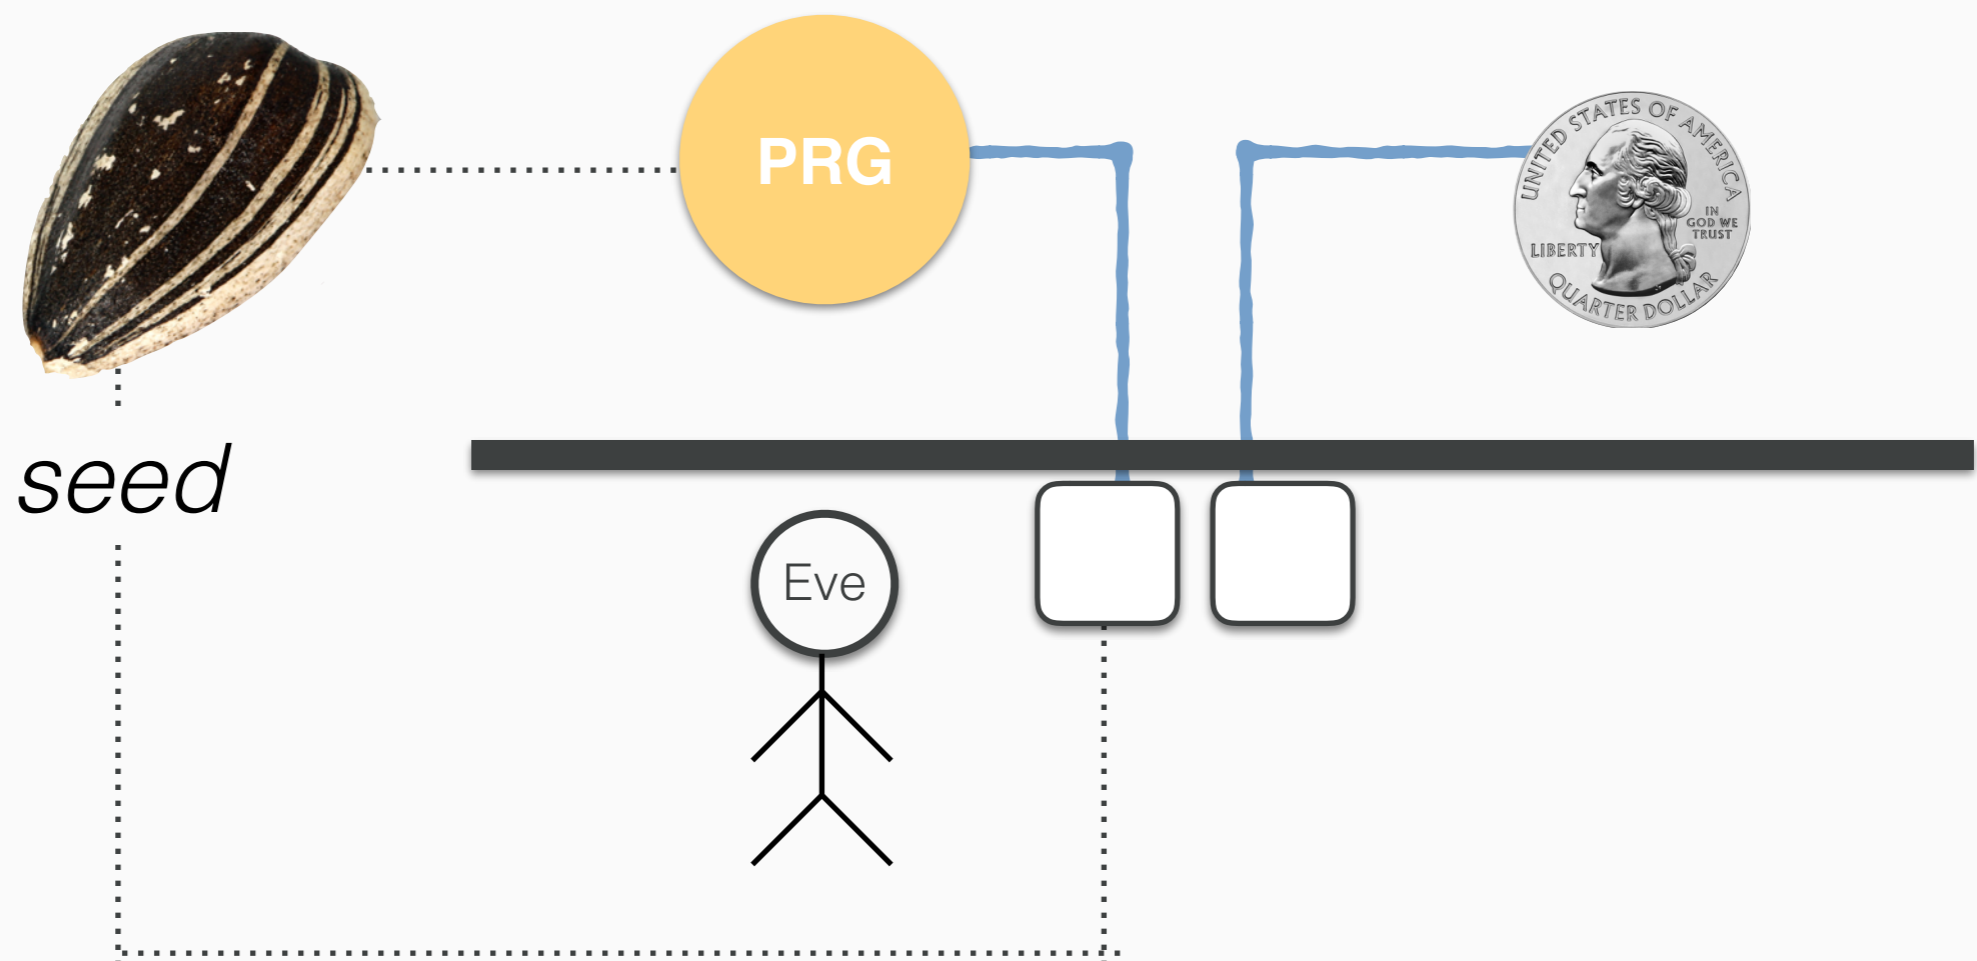

# Why Did I Cheat Before?

- An object that generates pseudorandom numbers is called a PseudoRandom Generator, or PRG
- PRGs require what is called a “seed”, which is effectively the input to the OWF.

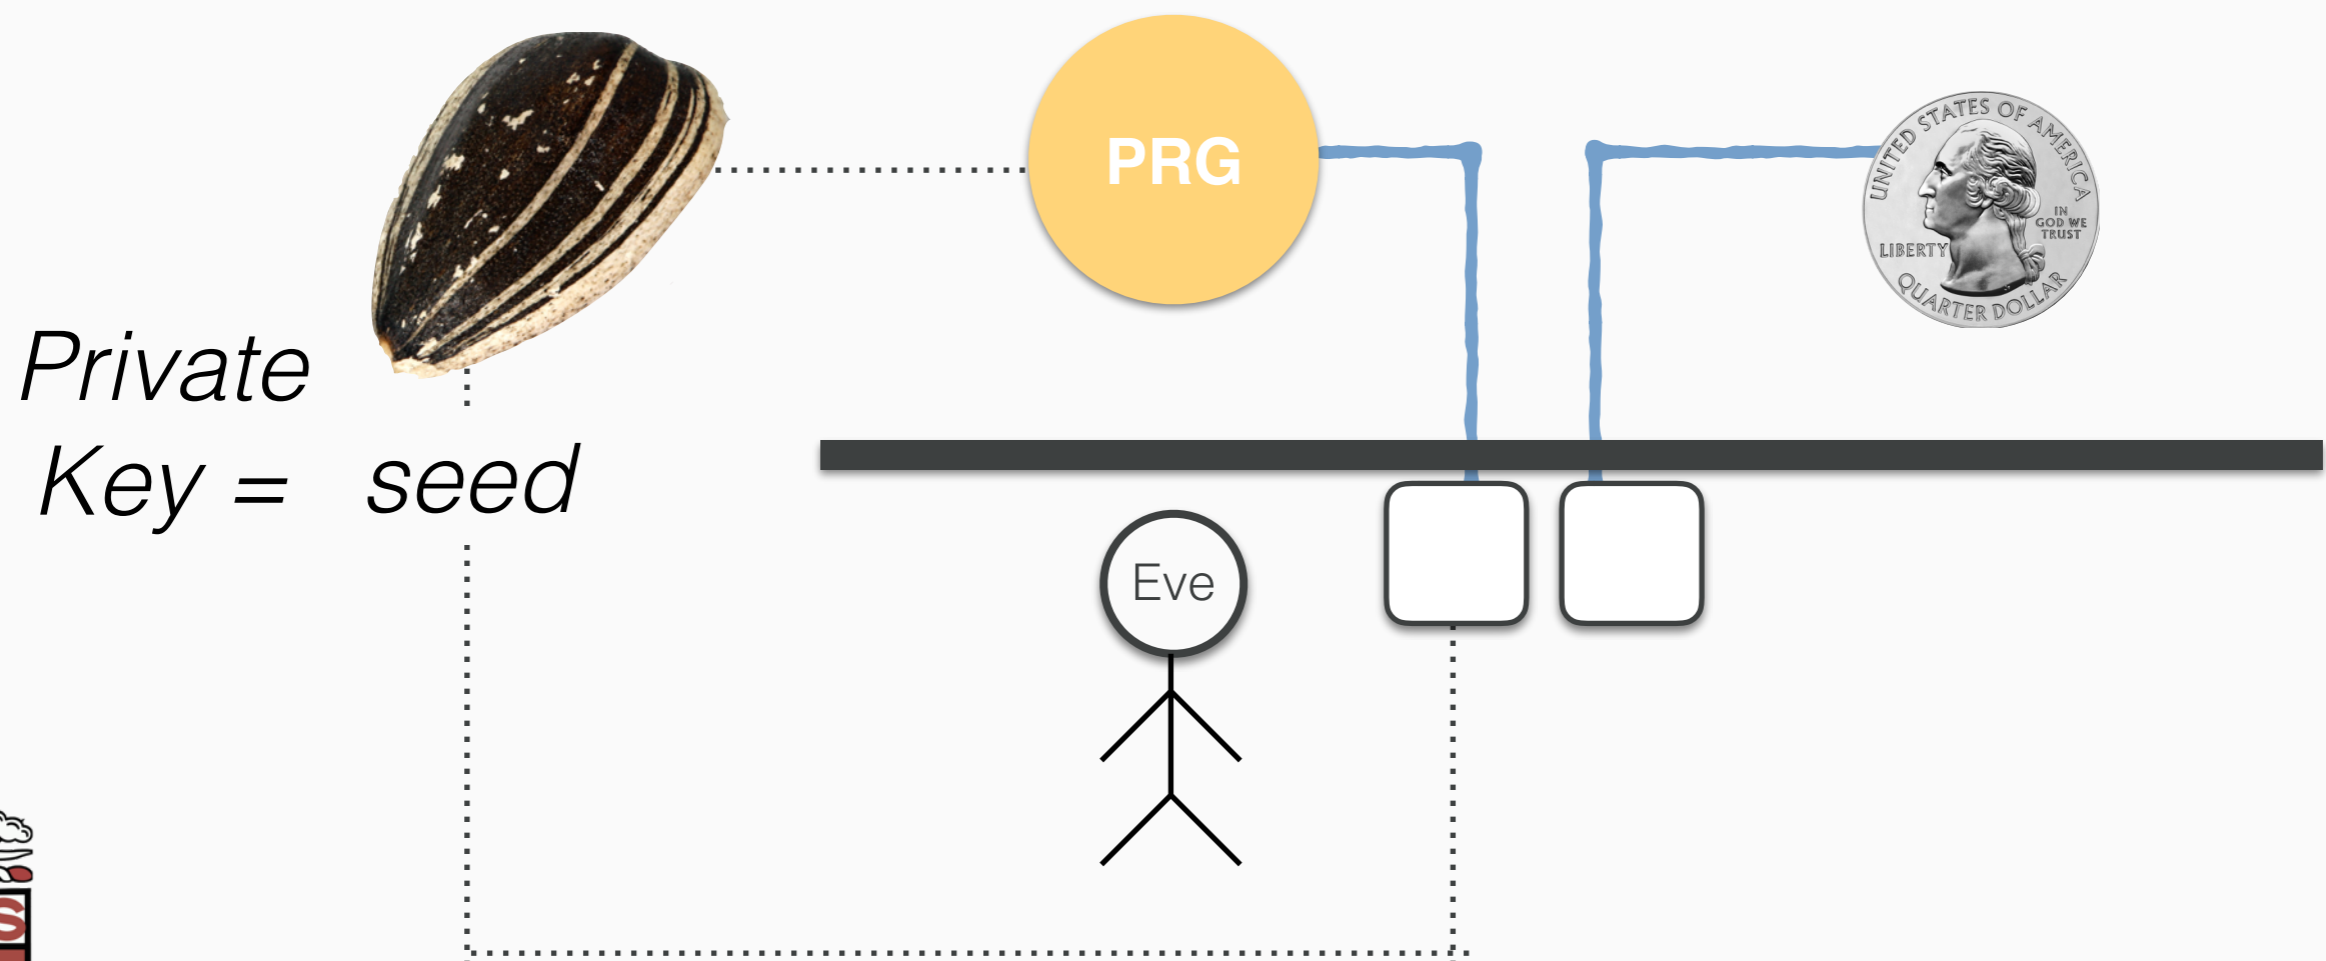

# Why Did I Cheat Before?

- Once we use this seed once, we can reset the seed by combining the output of our PRG with the old seed:

# Why Did I Cheat Before?

- Once we use this seed once, we can reset the seed by combining the output of our PRG with the old seed:

# OWFs as Pseudorandom Generators

- Intuition: If it's easy for you to figure out why something happened, then it's not really random.
- One Way Function: It's hard to figure out the input, given the output.
- Conclusion: we can extend One Way Functions to create Pseudo Random Number Generators (and not cheat)!

# Computation meets Biology

- Computation and:

1. Medicine

2. Genetics

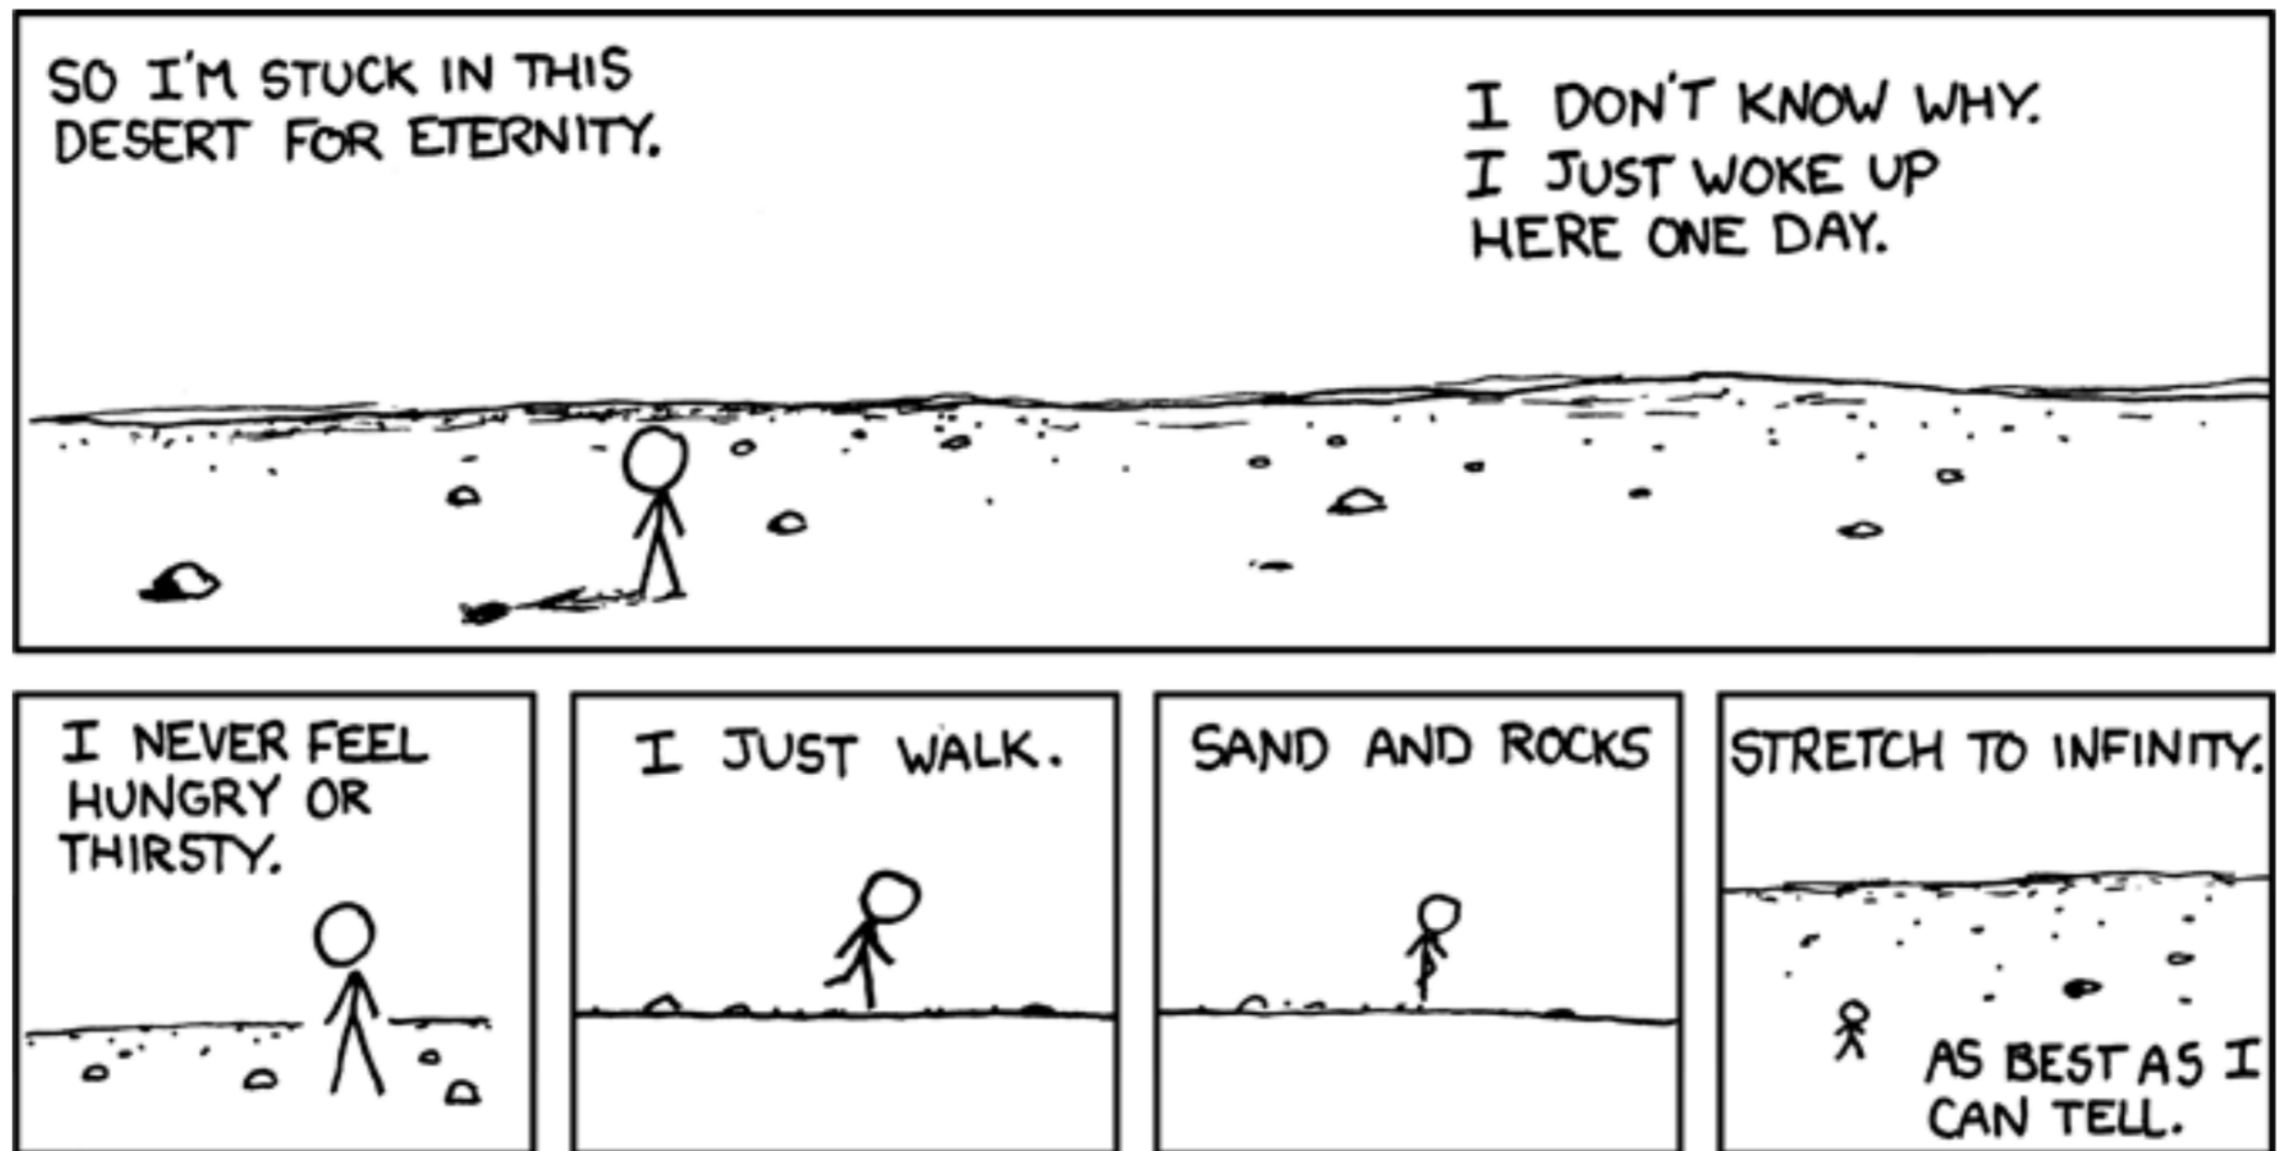

3. Sustainability

4. Neuroscience

5. Evolution

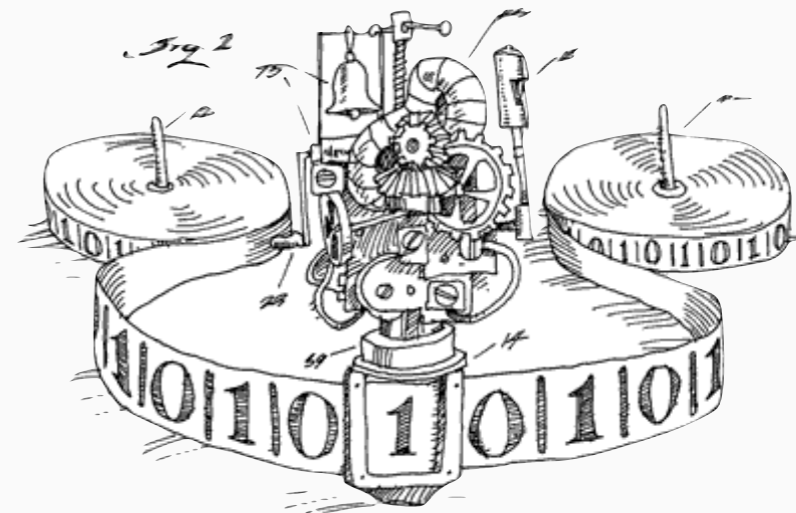

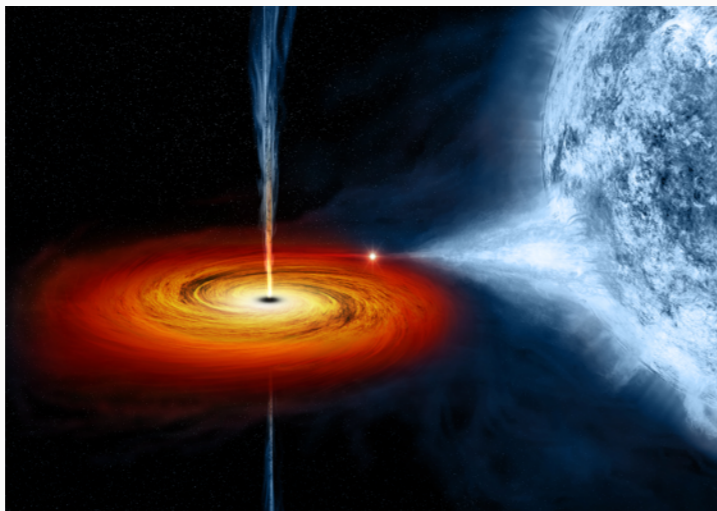

# Digital Physics

# Computation as a Tool for Understanding Reality

- Newton: use math to model the laws of the world.
- Turing: “the extent and limitations of mechanistic explanations of nature”

<http://www.worldofcomputing.net/wp-content/uploads/2013/01/turingMachine.gif>

# 1. Computation + Medicine

# Medical Diagnosis

- INPUT: A patient's symptoms
- OUTPUT: A medical diagnosis

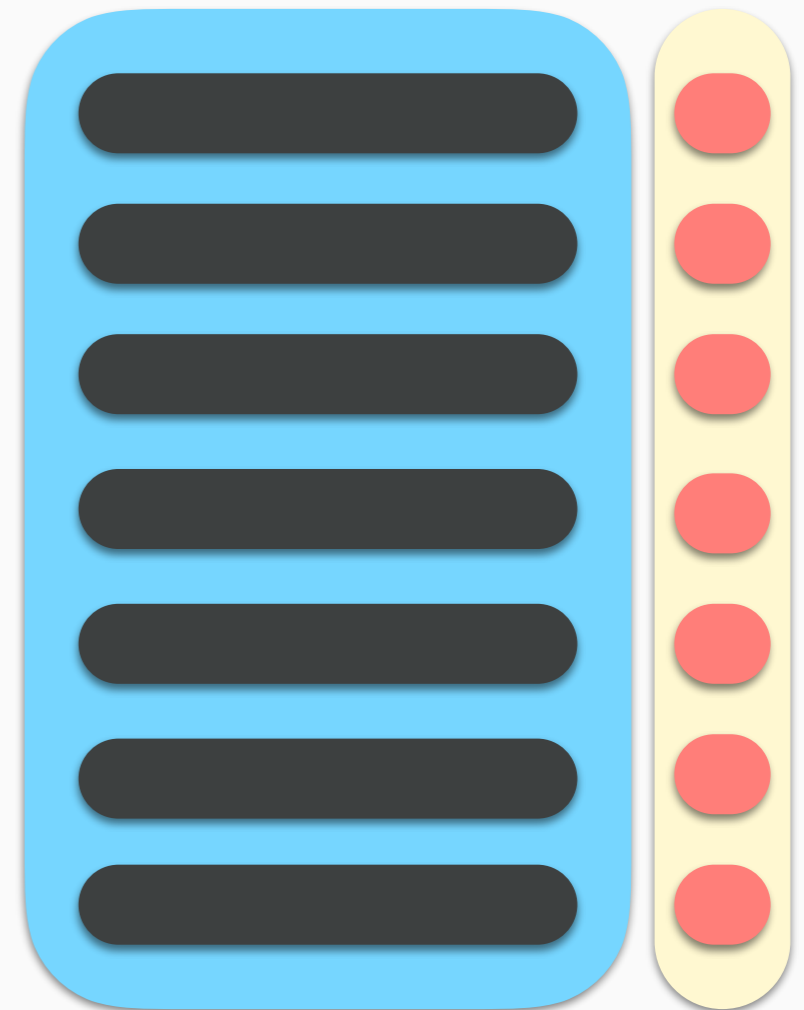

# Medical Diagnosis

+ a Database!

- INPUT: A patient's symptoms
- OUTPUT: A medical diagnosis

 = symptoms

 = diagnosis

# K Nearest Neighbor

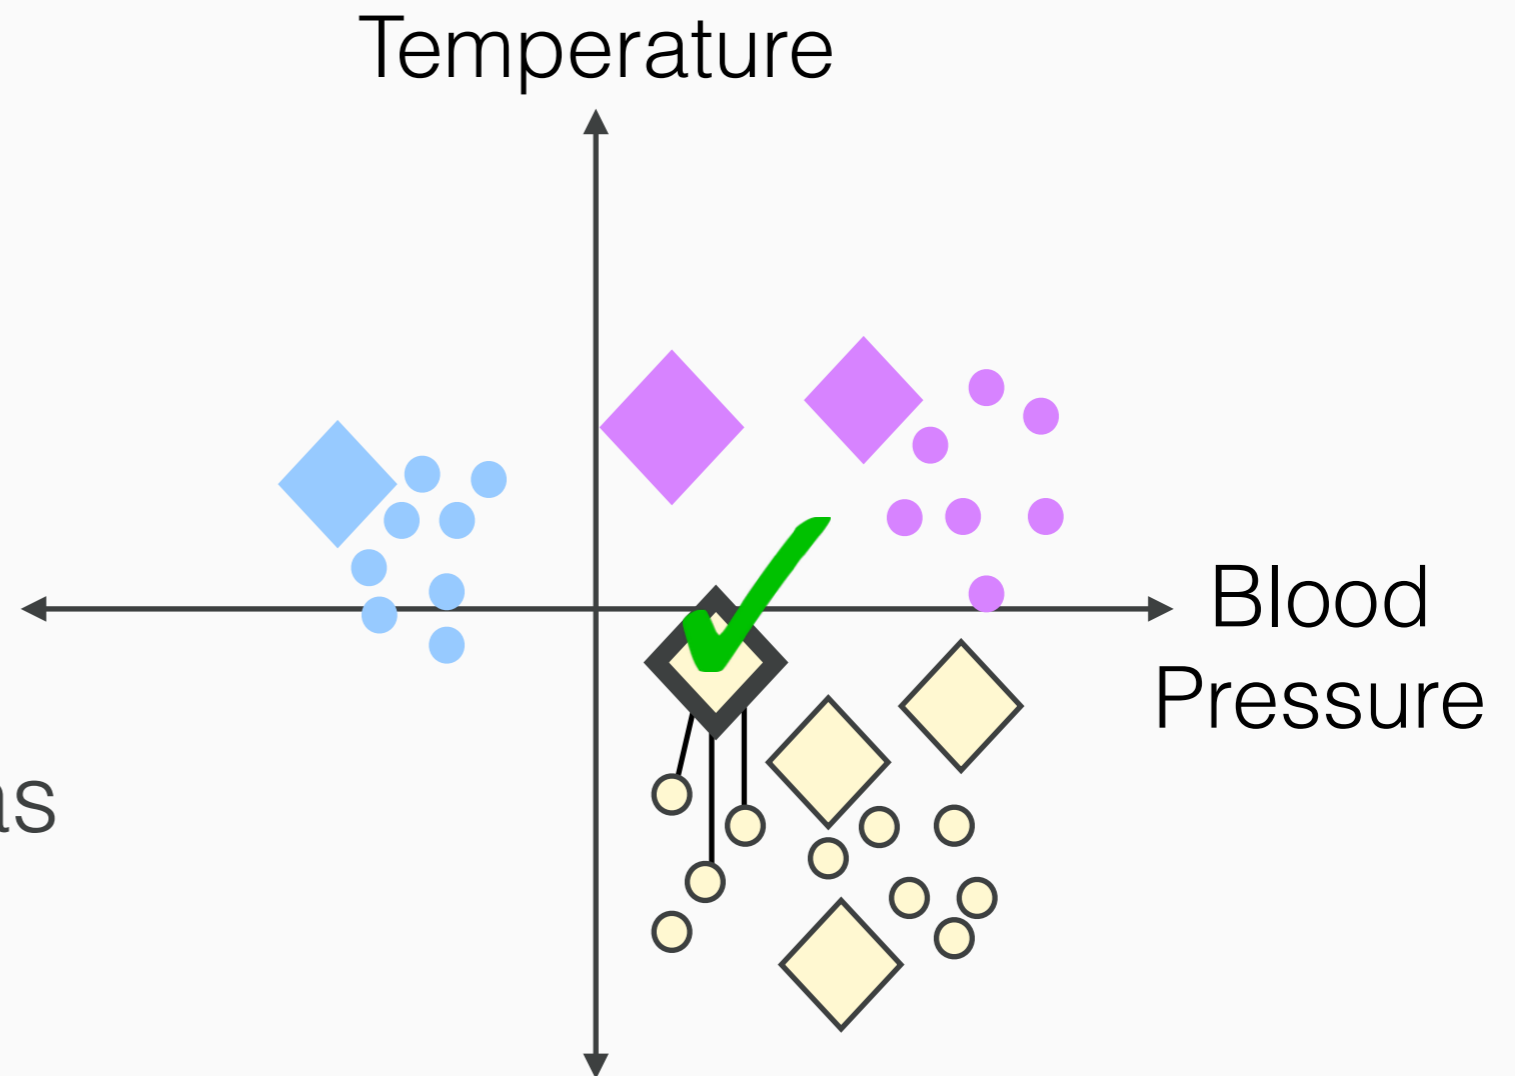

- = class one
- = class two
- = class three

$K = 3$

# K Nearest Neighbor

- Labels are now diagnoses
- Training Data are symptoms
- Medical Diagnosis as ML!

# IBM's Watson

# Kidney Donors

- Suppose a friend needs a kidney, and you want to donate yours to help your friend.
- Kidneys have a “type”, similar to blood; your friend needs a kidney of the right type.
- So instead you donate your kidney to a donor community; you give a kidney of any type, and get a kidney back for you friend of the right type.

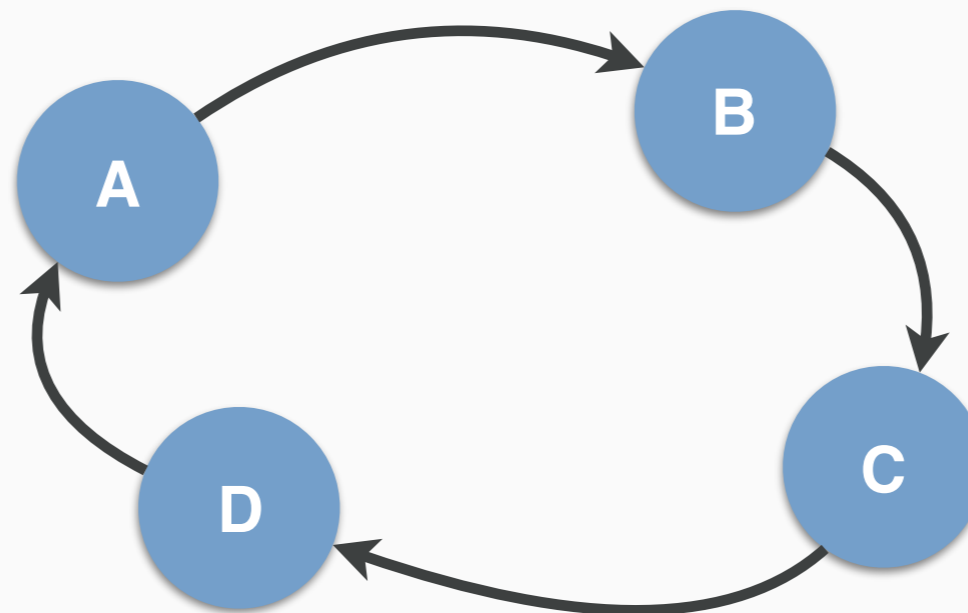

# Kidney Donors

- But once people get their kidney, they'll often back out of the donation!
- So instead, surgeons have started doing simultaneous kidney transplant surgeries, all at once, between circles of people.

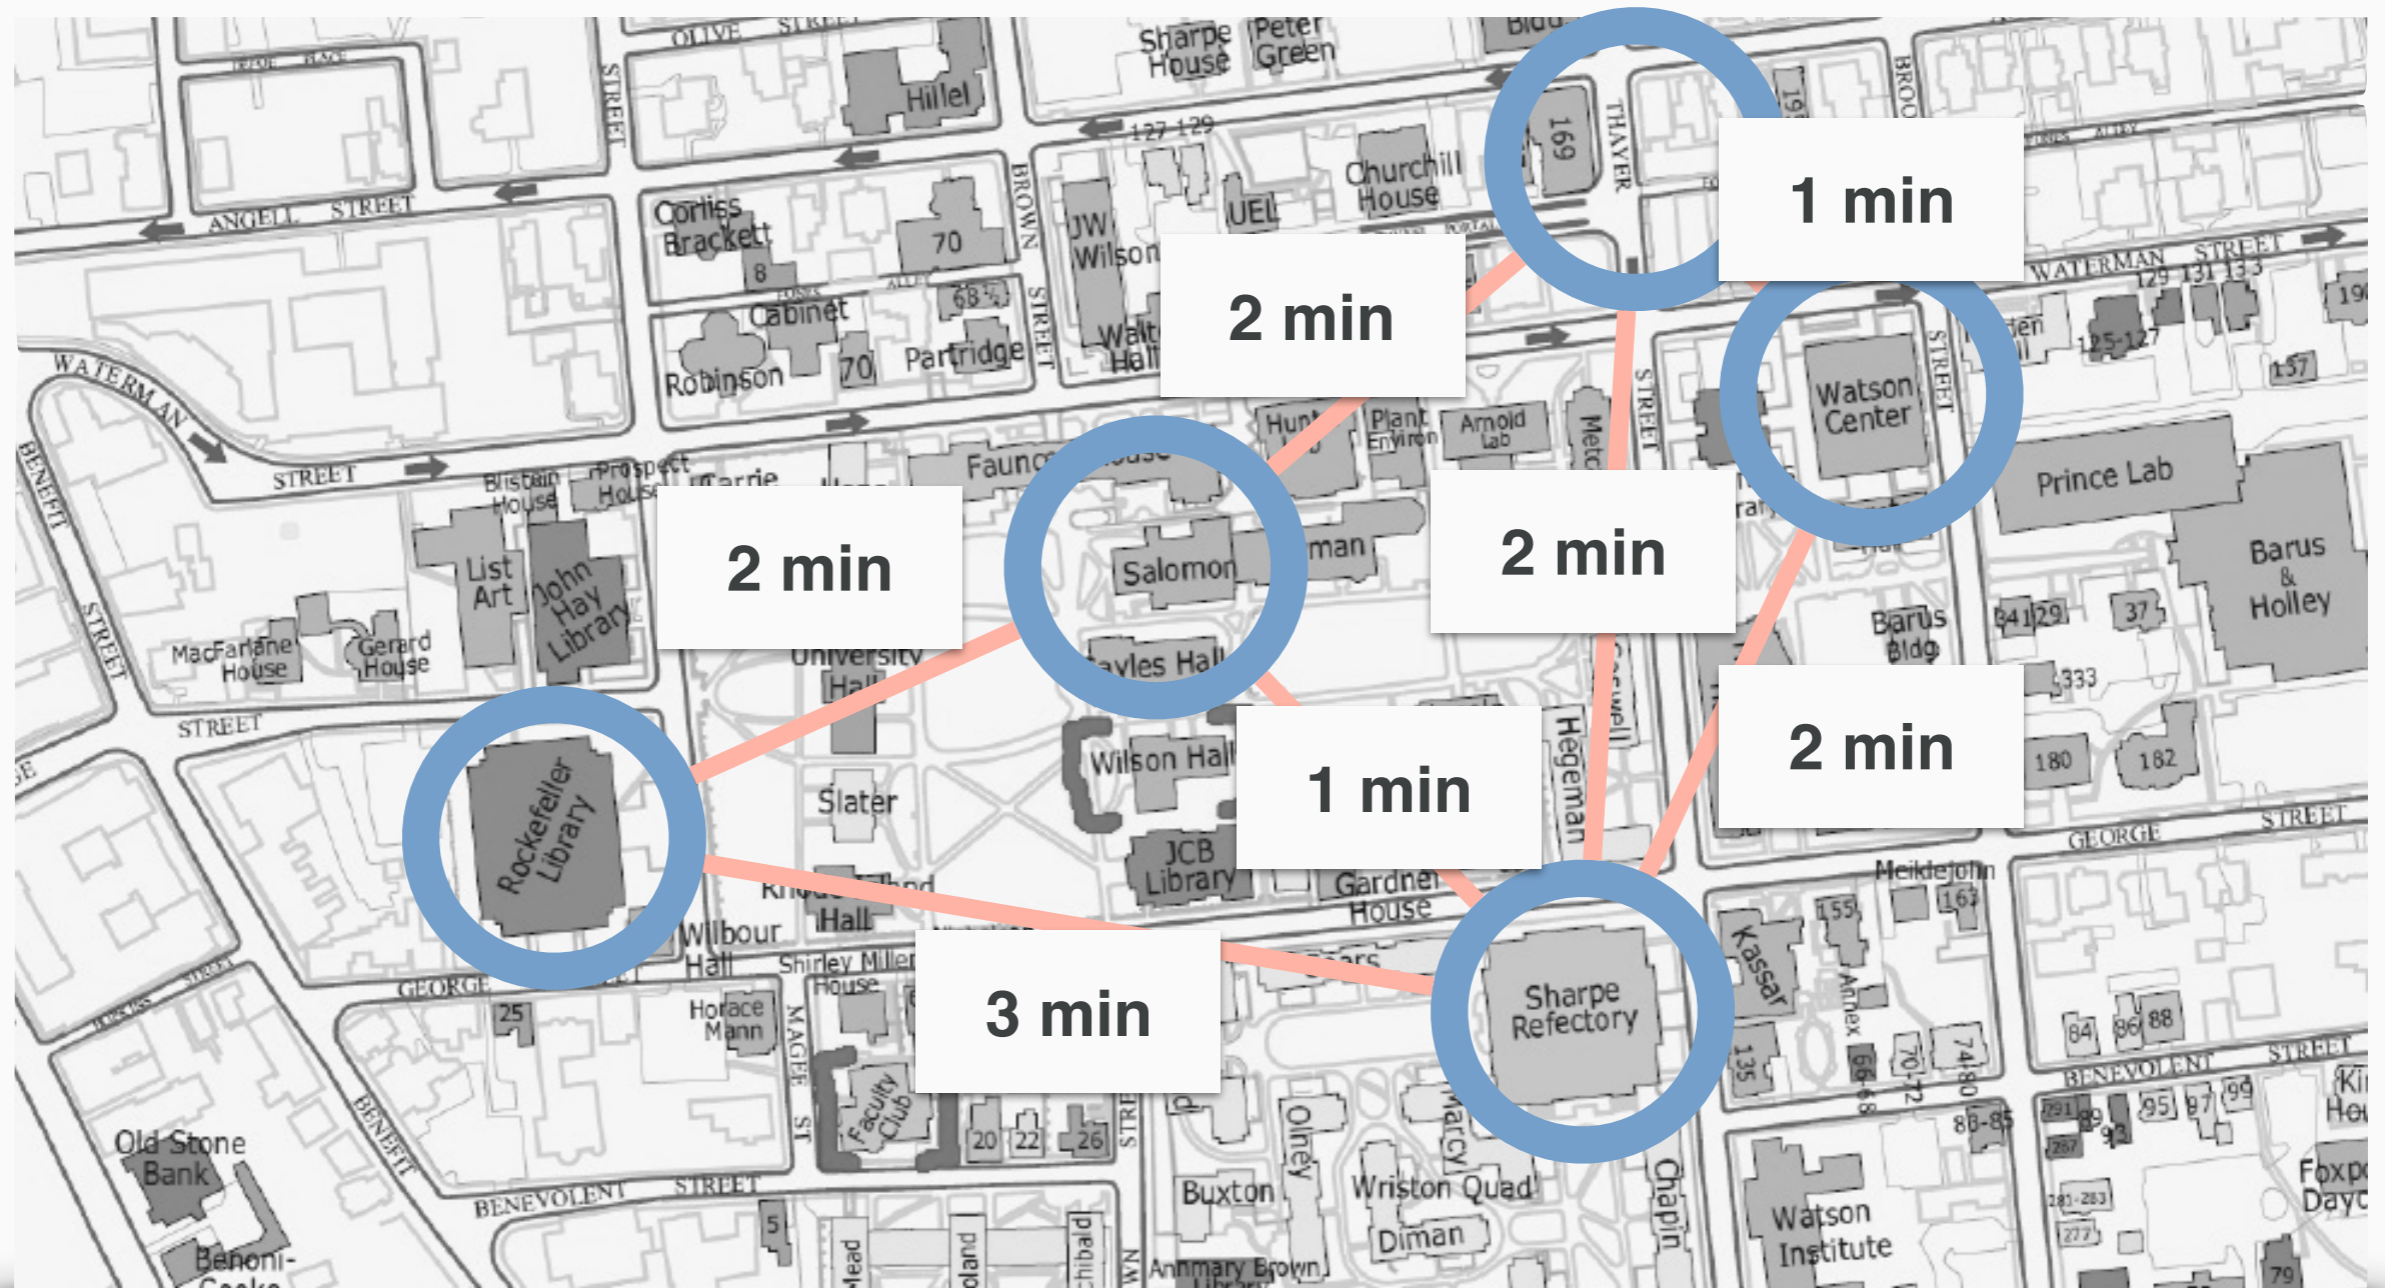

# Kidney Donors

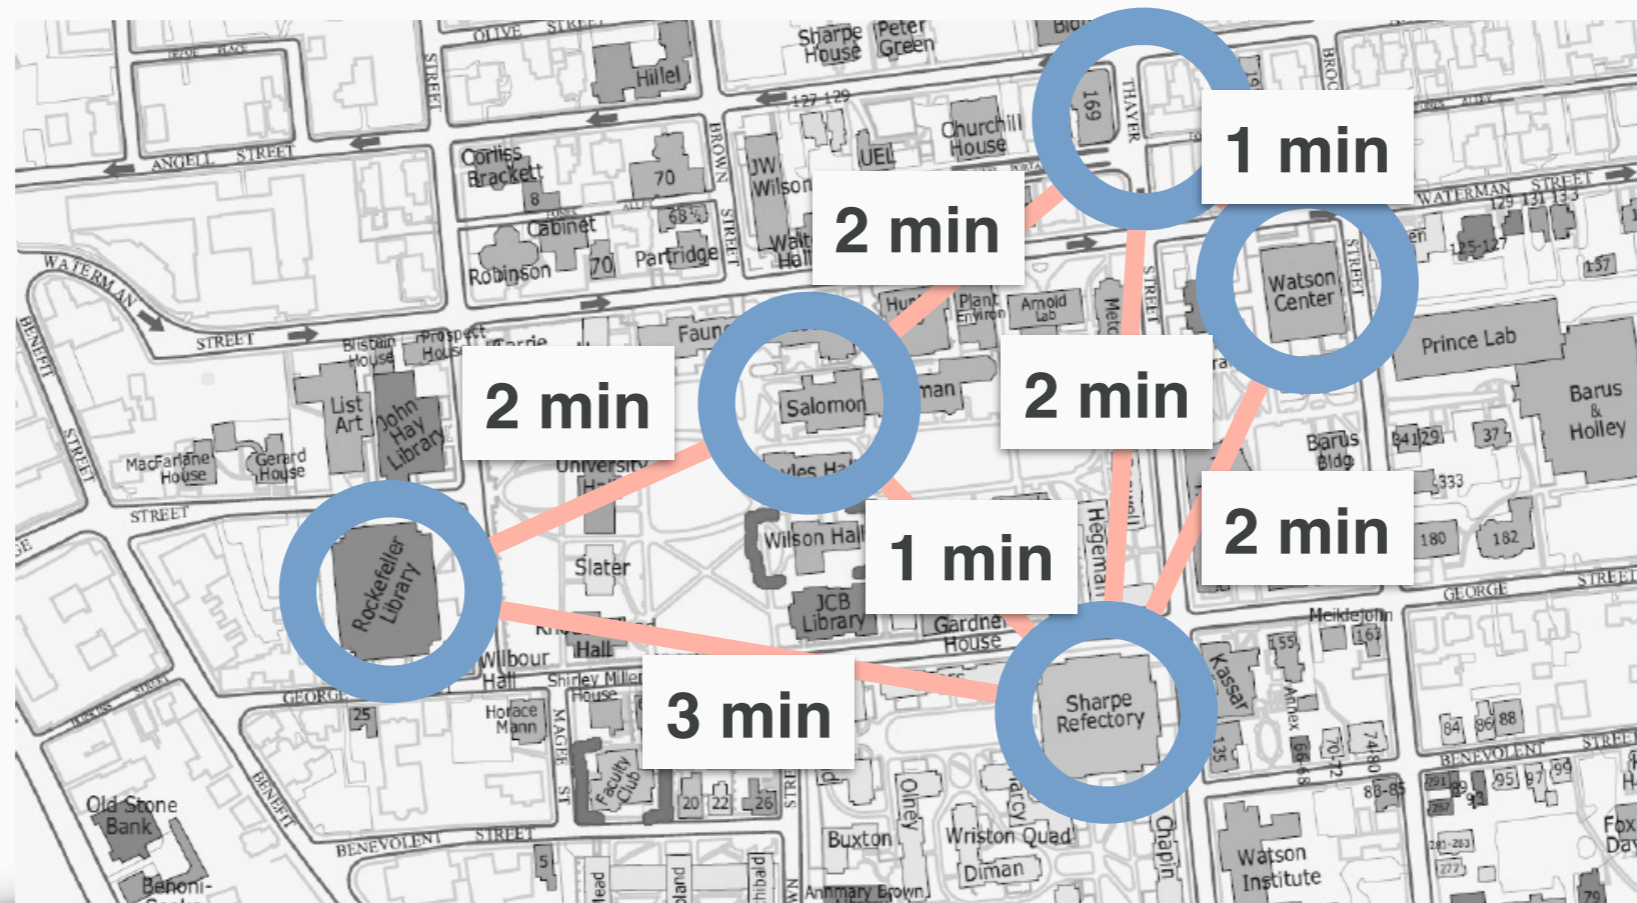

- But once people get their kidney, they'll often back out of the donation!
- So instead, surgeons have started doing simultaneous kidney transplant surgeries, all at once, between circles of people.

# Remember Circles + Lines?

# Circles + Lines!

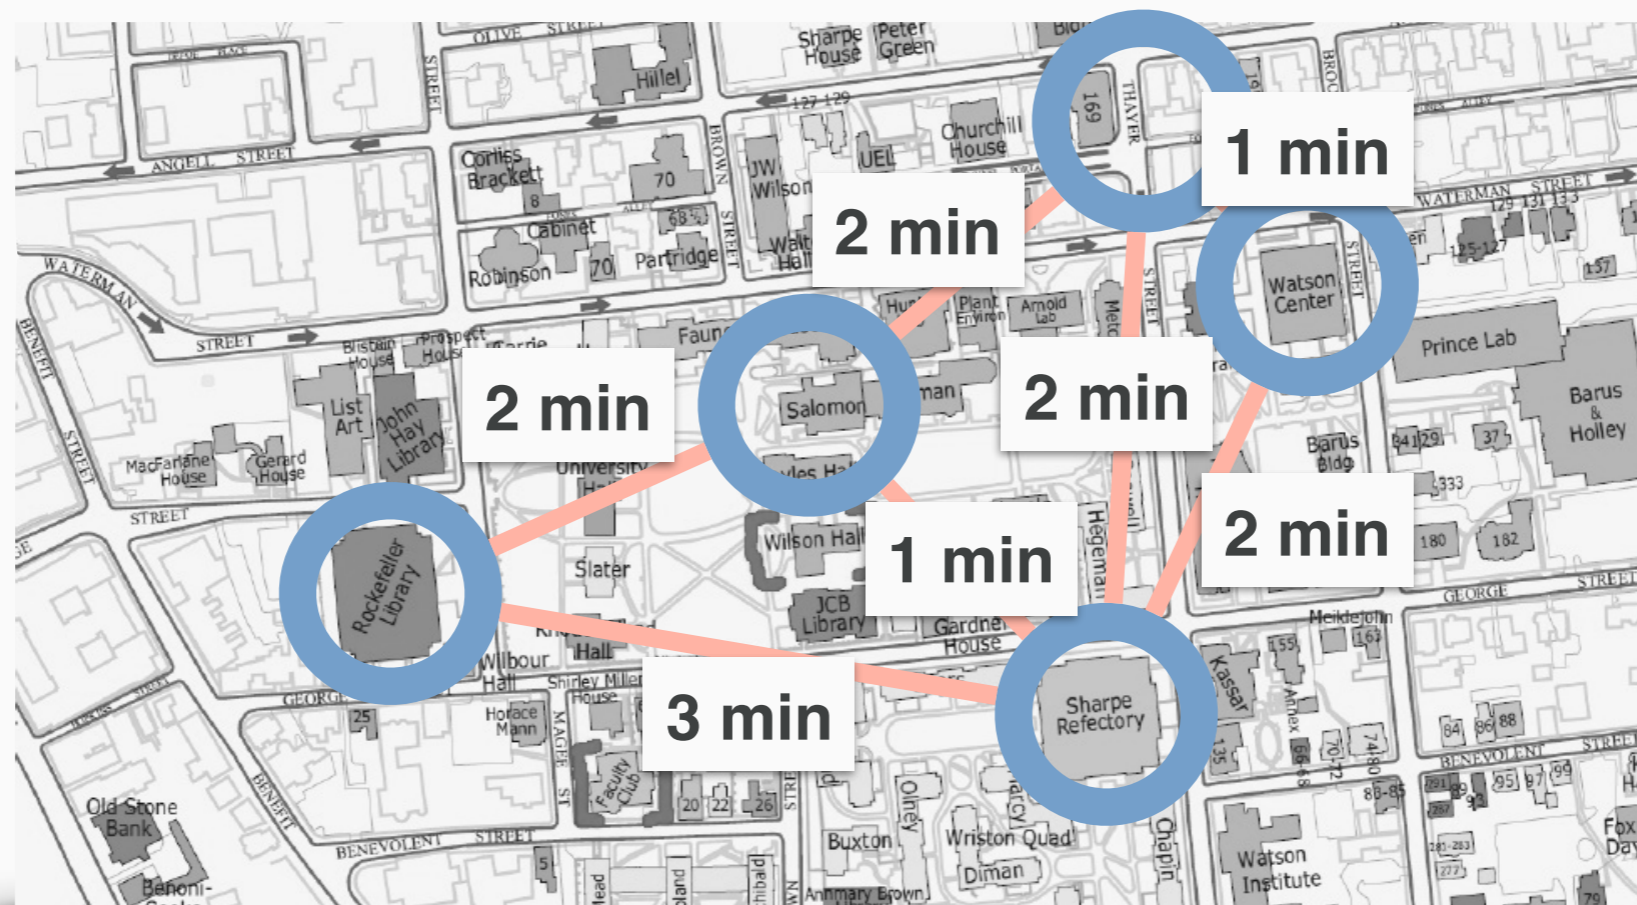

Circle: an object (a location in this case)

Line: a relation between objects (tram, in this case)

# Called a “Graph”

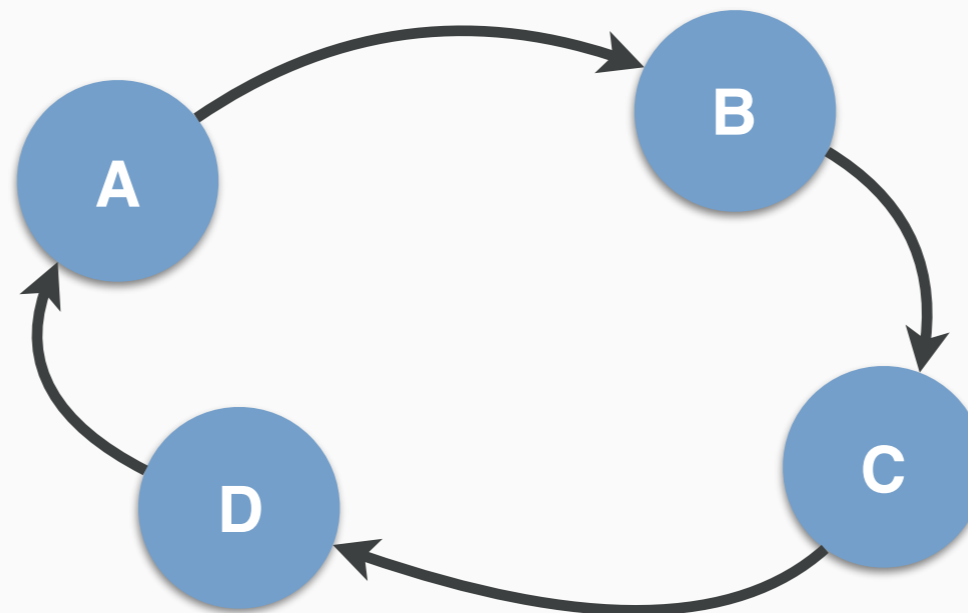

Circle: an object (a location in this case)

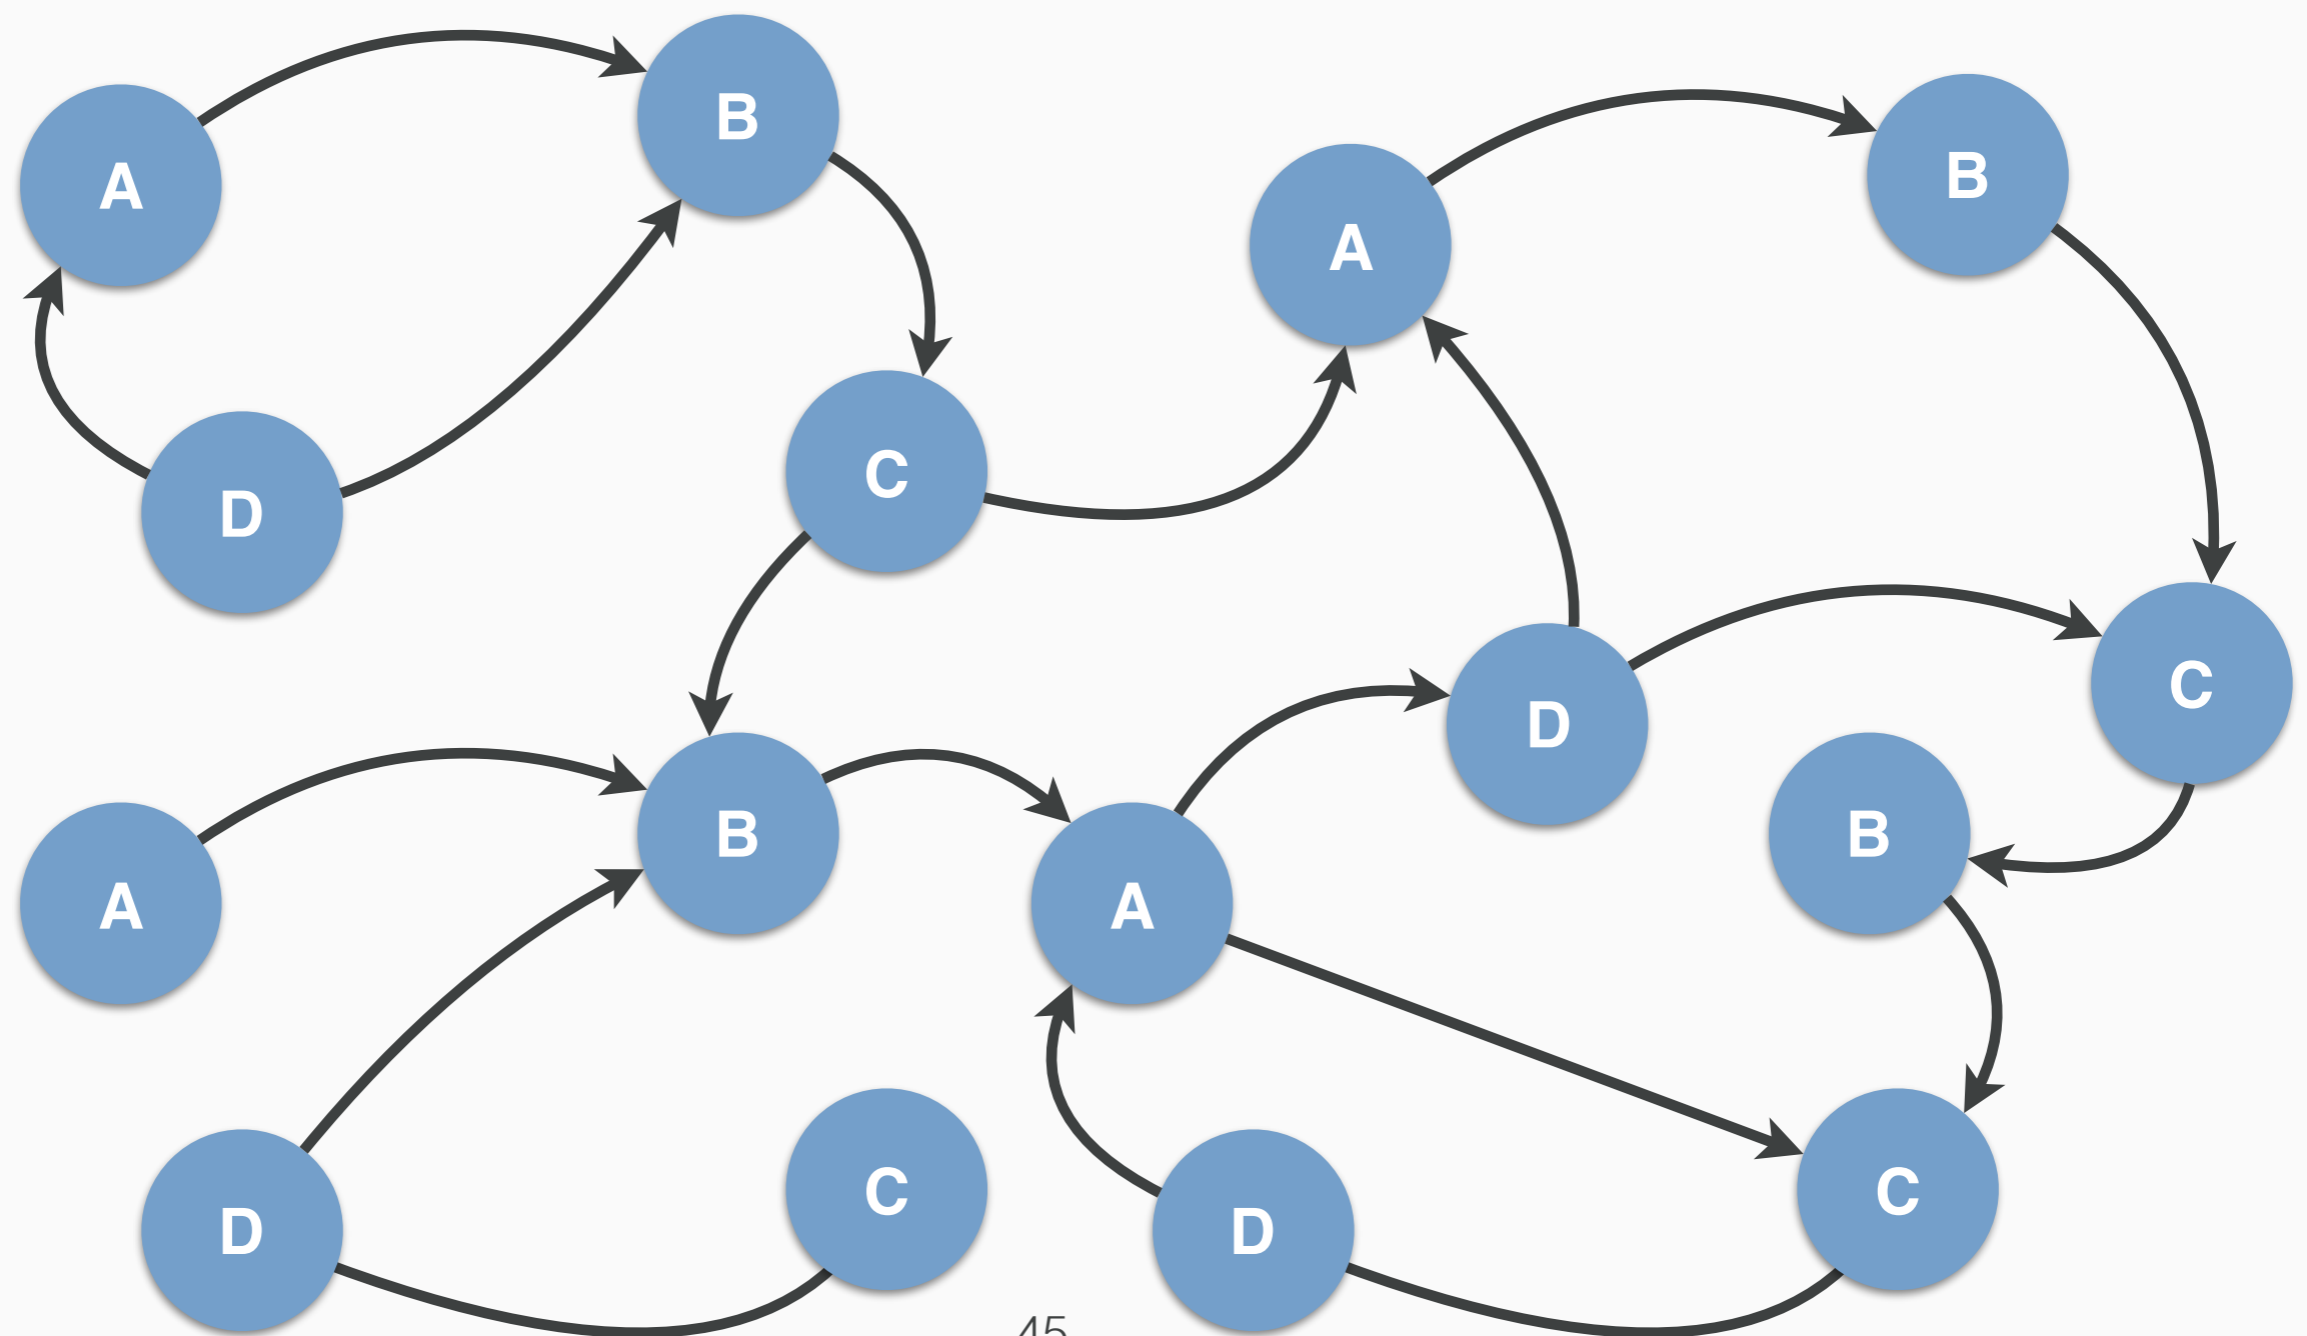

Line: a relation between objects (tram, in this case)

# Kidney Donors

- But once people get their kidney, they'll often back out of the donation!
- So instead, surgeons have started doing simultaneous kidney transplant surgeries, all at once, between circles of people.

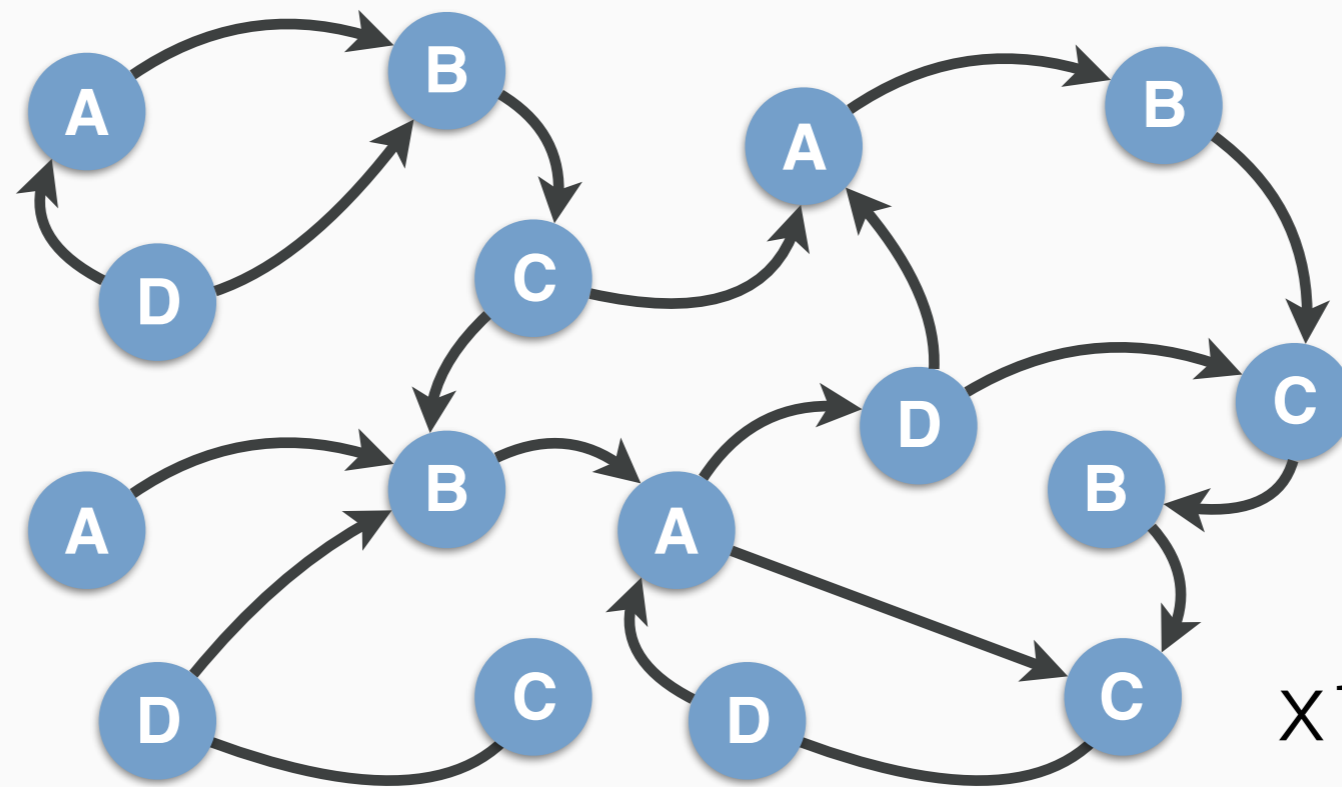

# Find the Cycles!

# Find the Cycles!

INPUT:

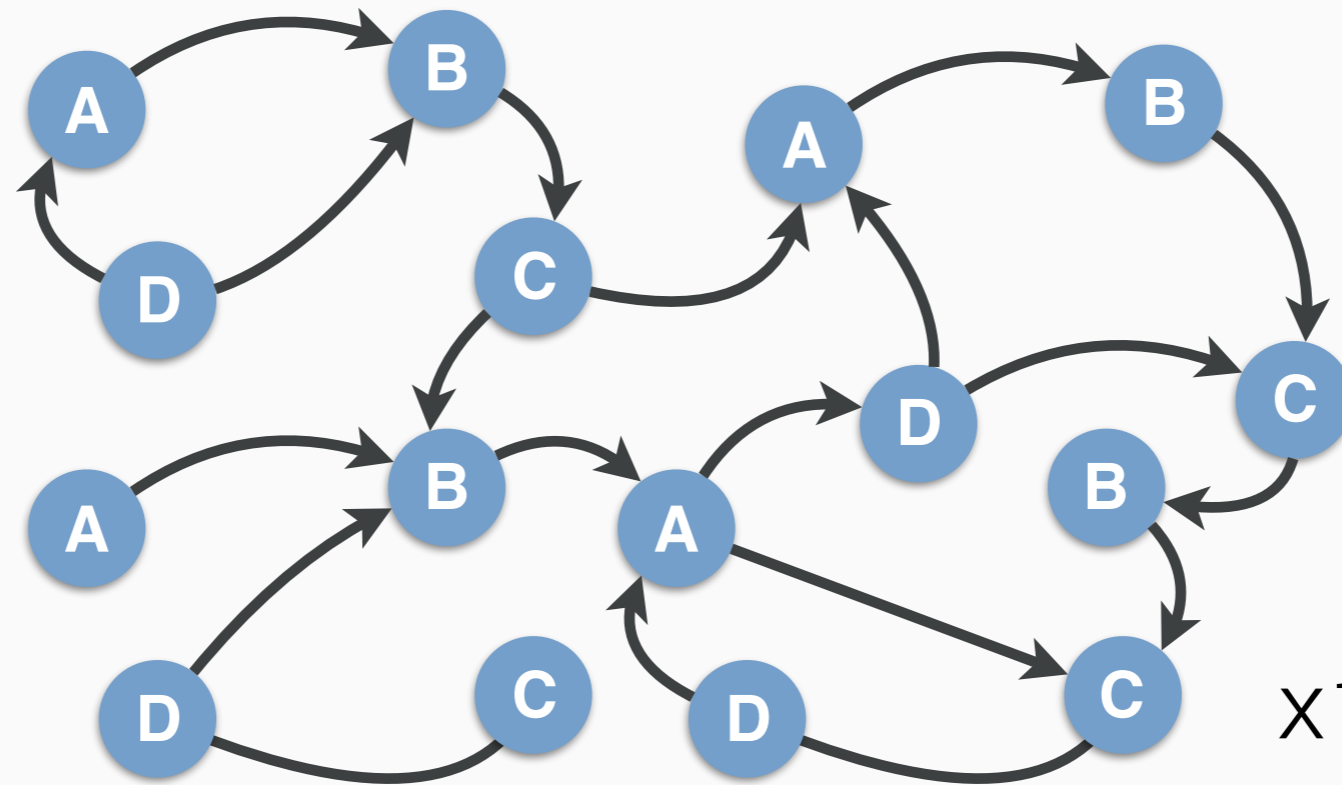

(with about  
x100000 more  
circles)

OUTPUT: A list of cycles

# Find the Cycles!

# INPUT:

(with about  
x100000 more  
circles)

OUTPUT: A list of cycles

# Computational Solutions!

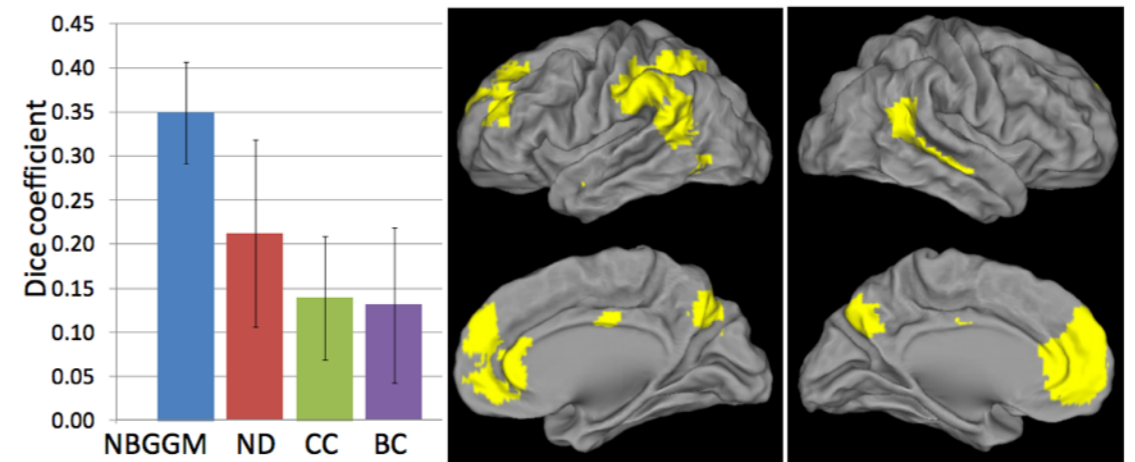

# Medical Imaging

# Medical Imaging

## Understanding Brain Region Functionality

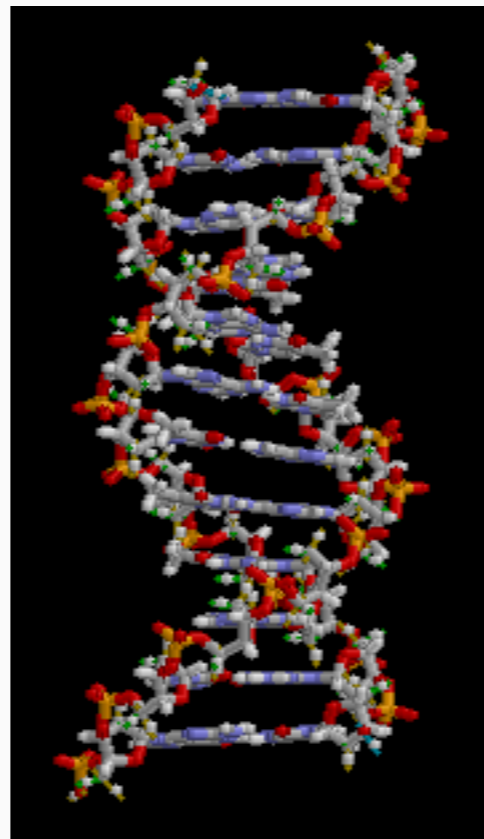

[Ng, Milazzo, Atmman, 2015]

**Fig. 3.** AD vs HC. NBGGM provided significantly higher consistency in the identified brain regions than the contrasted methods. Regions found by NBGGM shown in yellow.

# 2. Genome Sequencing

- DNA: molecule for carrying genetic information
- Four “bit” values: A, G, T, C

# Genome Sequencing

- Goal: understand what is going on in the DNA.
- Application: Cancer Research.

# Genome Sequencing

- Goal: understand what is going on in the DNA.
- Application: Cancer Research.

AGAGATTAGCTAGCAATCGCGGGATAGCGCTAGCTAGCACGAGGGGAGTTCCTAGAC

# Genome Sequencing

- The tool we have for reading DNA gives us snippets:

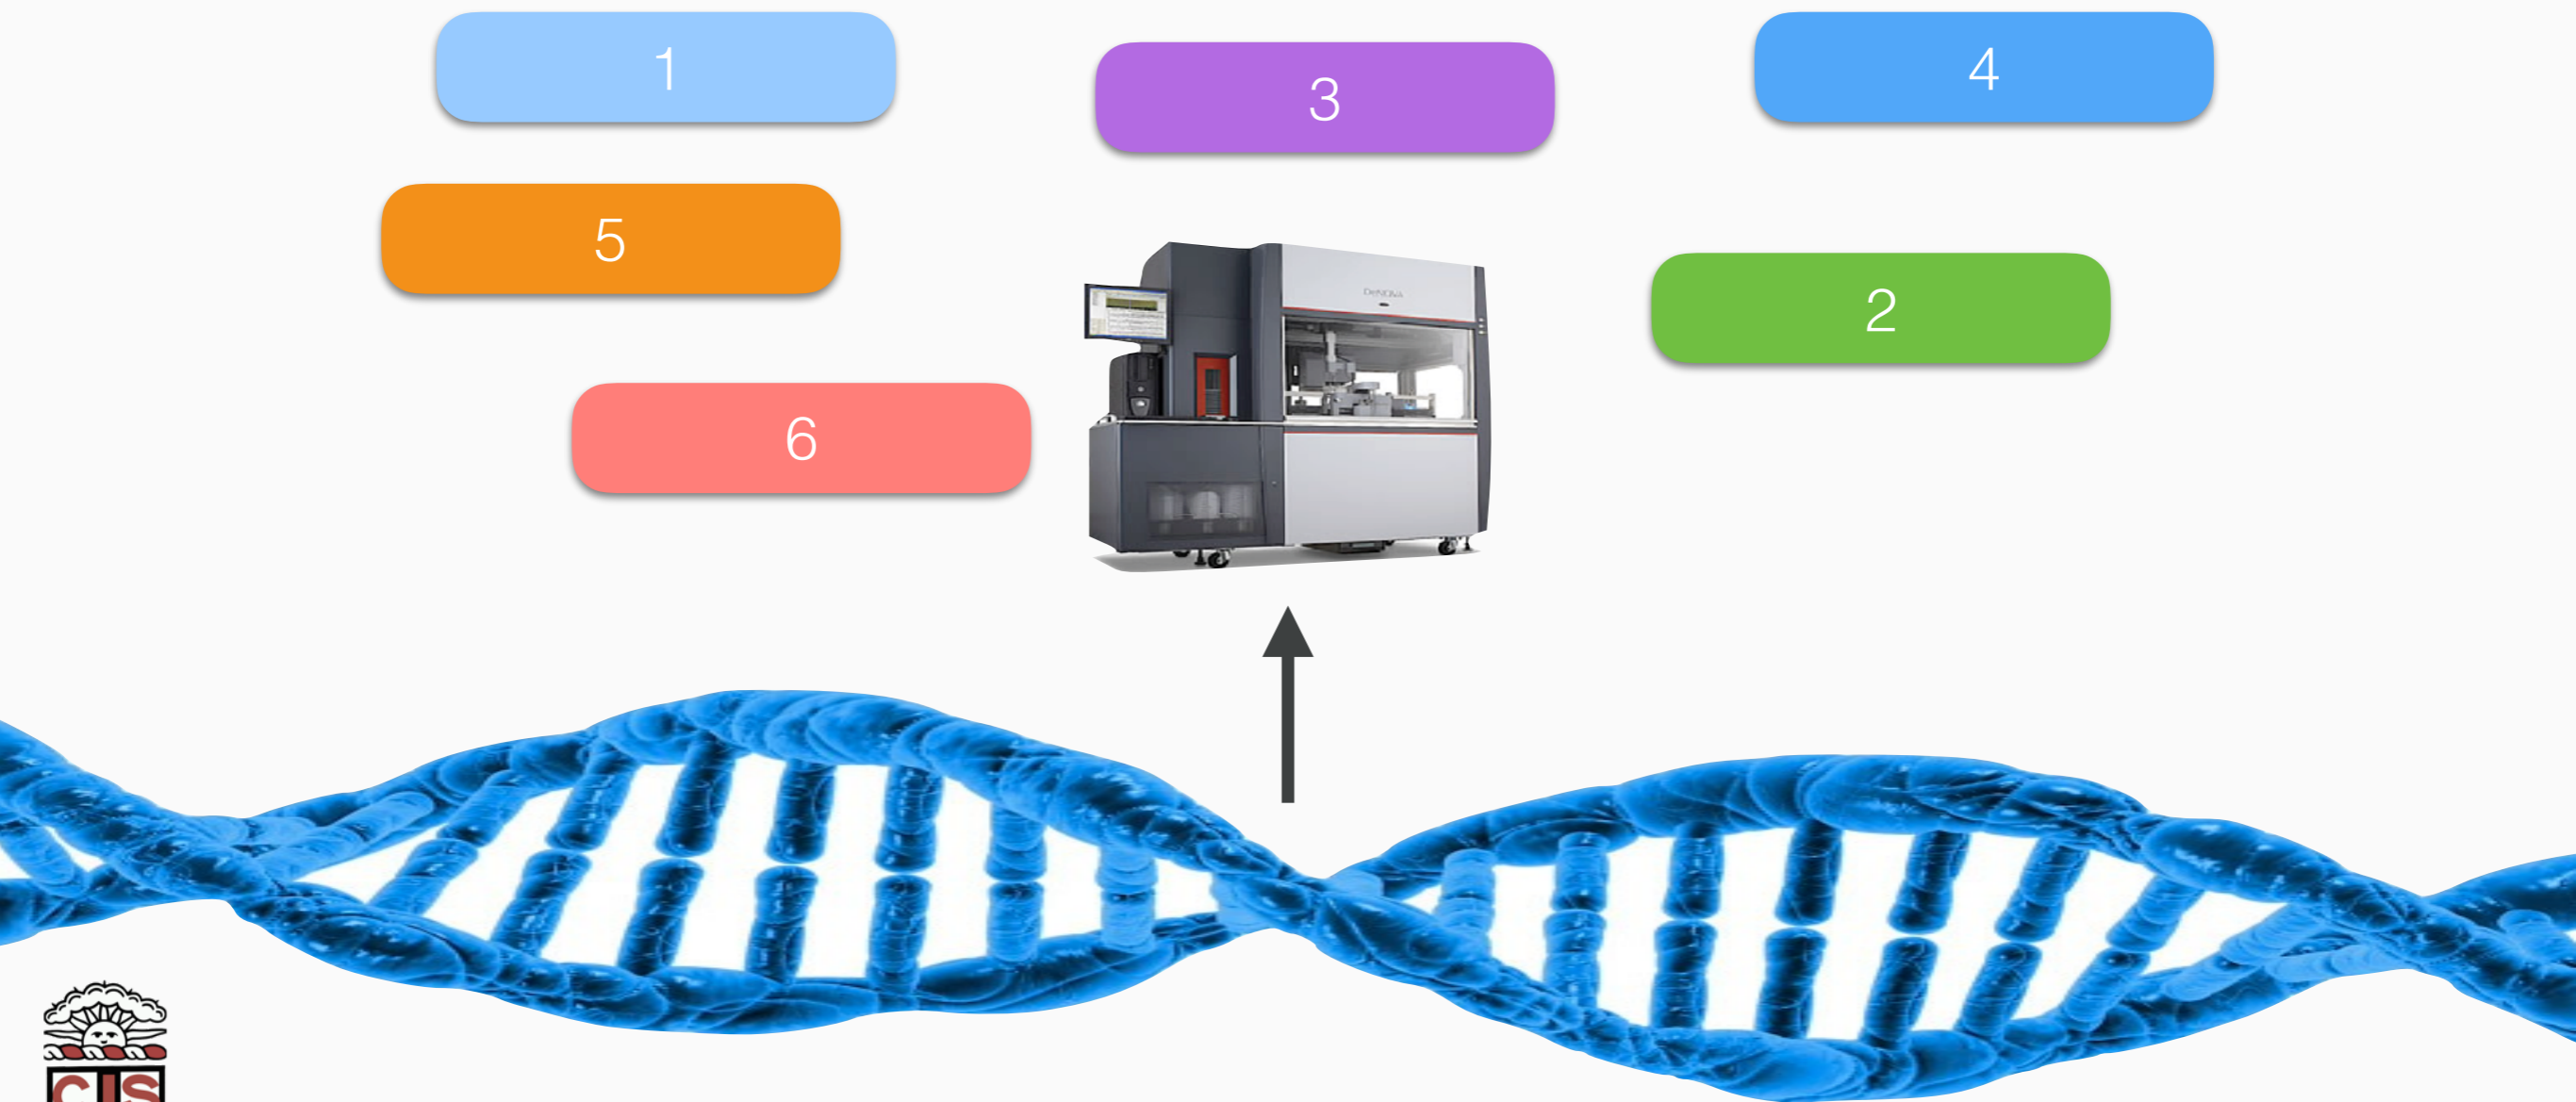

AGAGATTAGCTAGCAATCGCGGGATAGCGCTAGCTAGCACGAGGGGAGTTCCTAGAC

# Genome Sequencing

- The tool we have for reading DNA gives us snippets:

# Genome Sequencing

- Problem: Recreate DNA from snippets

INPUT:

OUTPUT:

AGAGATTAGCTAGCAATCGCGGGATAGCGCTAGCTAGCACGA

# Genome Sequencing

- Problem: Recreate DNA from snippets

INPUT:

OUTPUT:

AGAGATTAGCTAGCAATCGCGGGATAGCGCTAGCTAGCACGA

**Computational Solutions!**

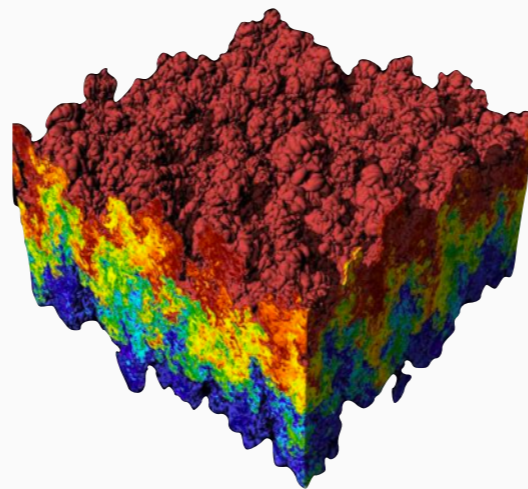

# Computation & Genome Sequencing

- Used for better understanding cancer mutations, cancer growth, occurrences of cancer, treatment.
- Used for computational evolutionary biology; evaluate disorders, changes of a species over time.
- And more!

# 3. Computation and Environmental Science

# RL + Sustainability

- Reinforcement Learning:
  - Learn through reward/punishment
  - Learn a model of the world
  - Maximize long term reward

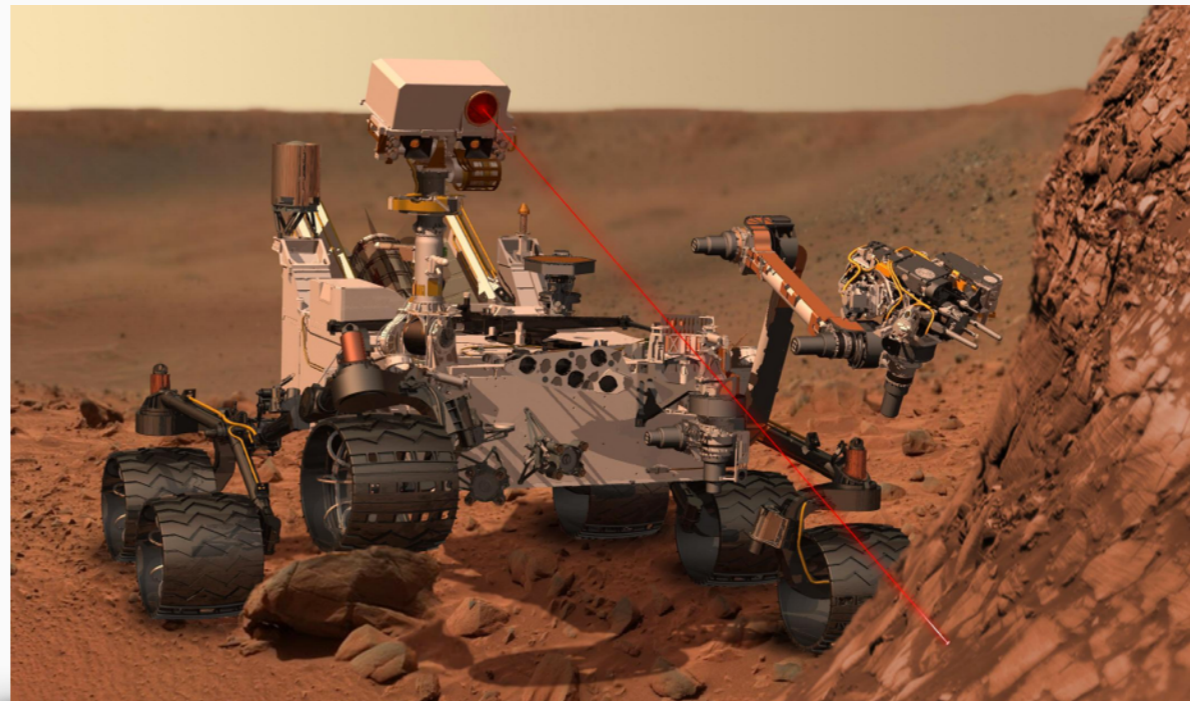

# Renewable Resource Allocation (RRA)

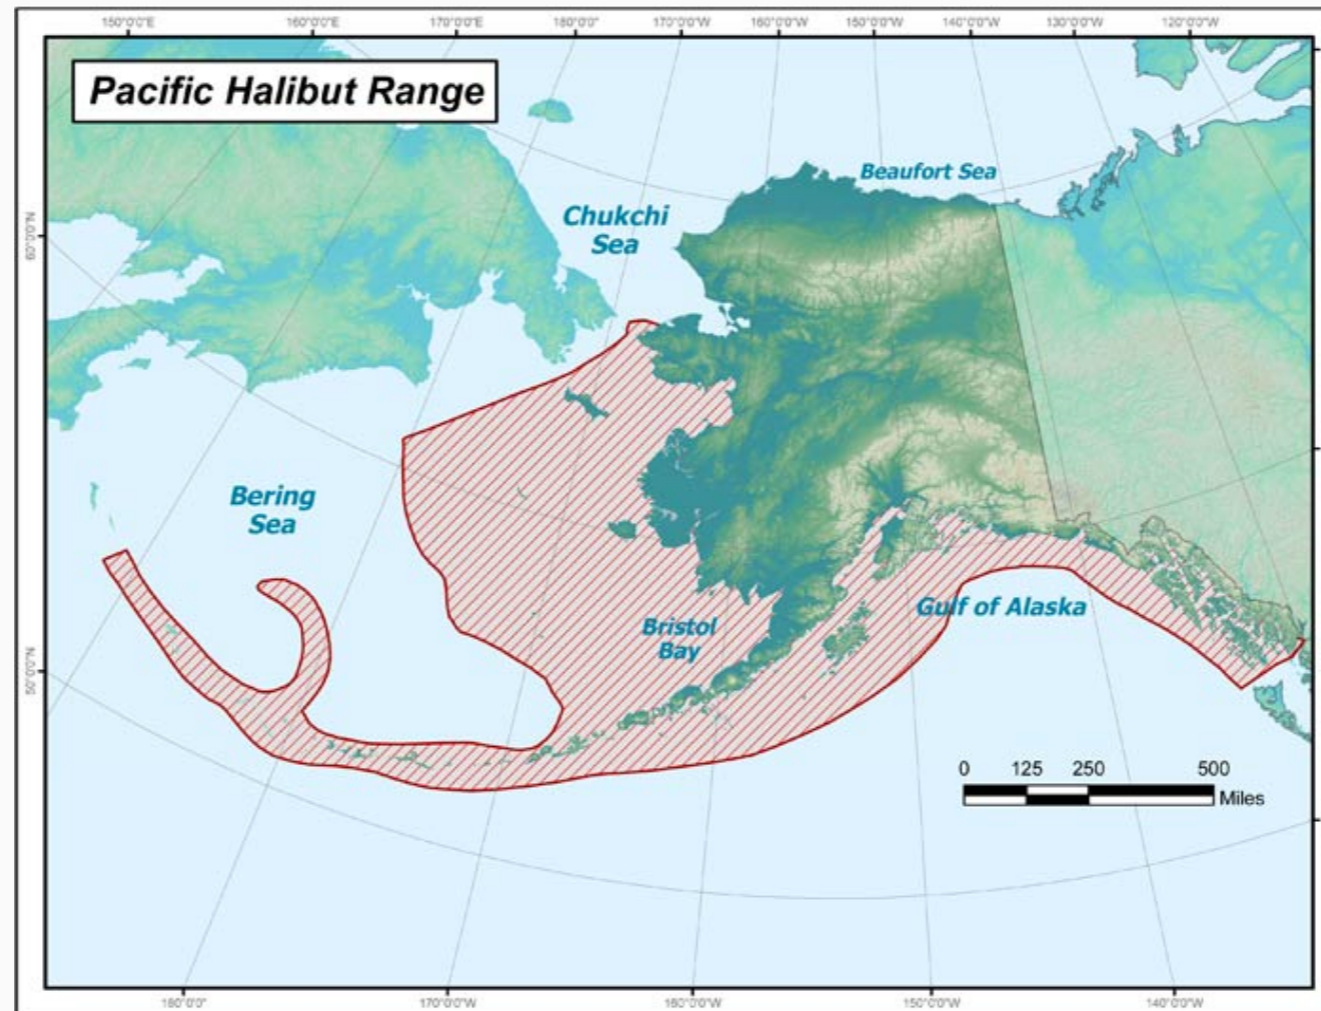

- Resource Allocation: How to distribute a resource to a variety of entities that need/want it?
- *Renewable* Resource Allocation: How should our strategy differ when the resource is renewable?
  - We have 10 carrots planted.
  - As of Friday, each carrot that is still planted will create two more carrots.
  - 20 people each want a carrot, now.

# RL + RRA

# The Pacific Halibut

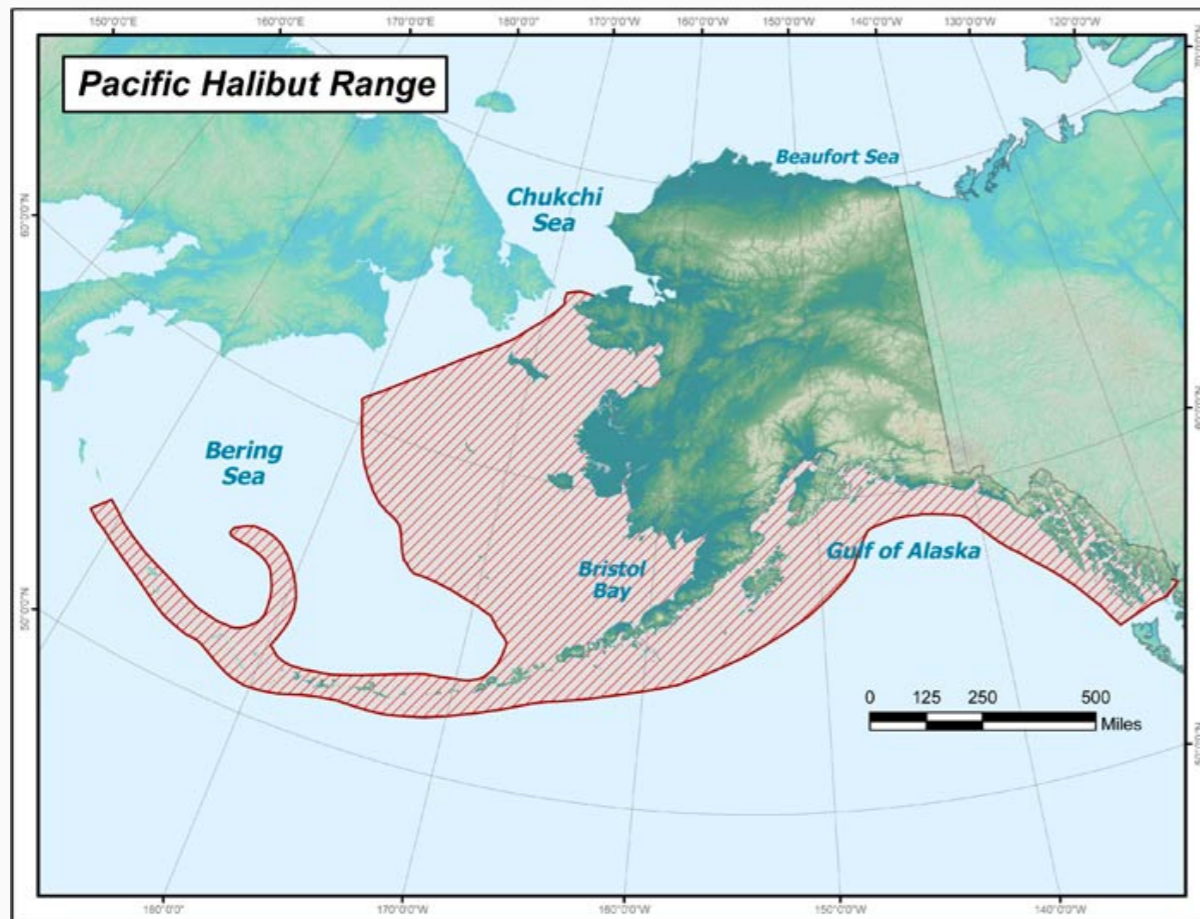

Idea: If RL can solve Mario and Go, it ought to be able to solve other problems in the real world of similar difficulty.

# The Pacific Halibut

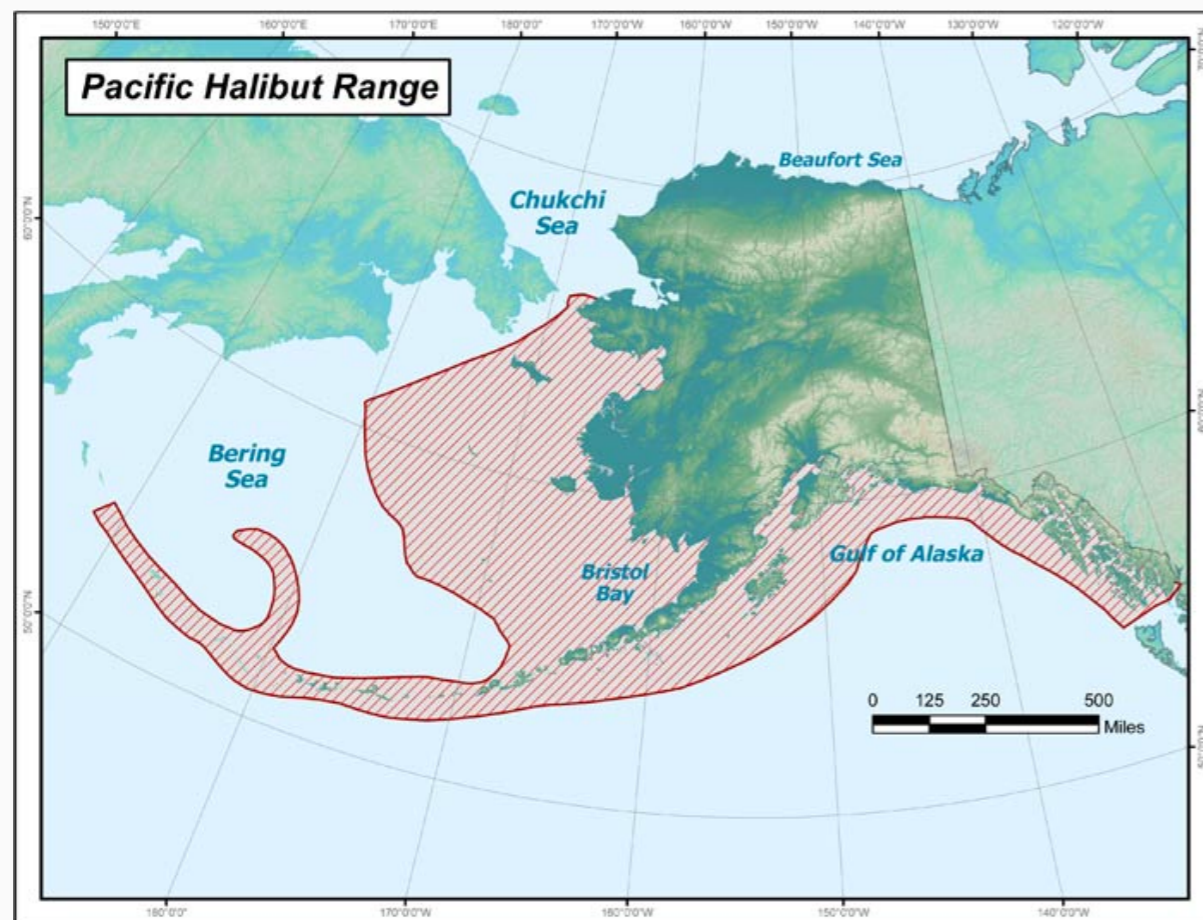

1. Learn a model of fish hatchery behavior

Idea: If RL can solve Mario and Go, it ought to be able to solve other problems in the real world of similar difficulty.

# The Pacific Halibut

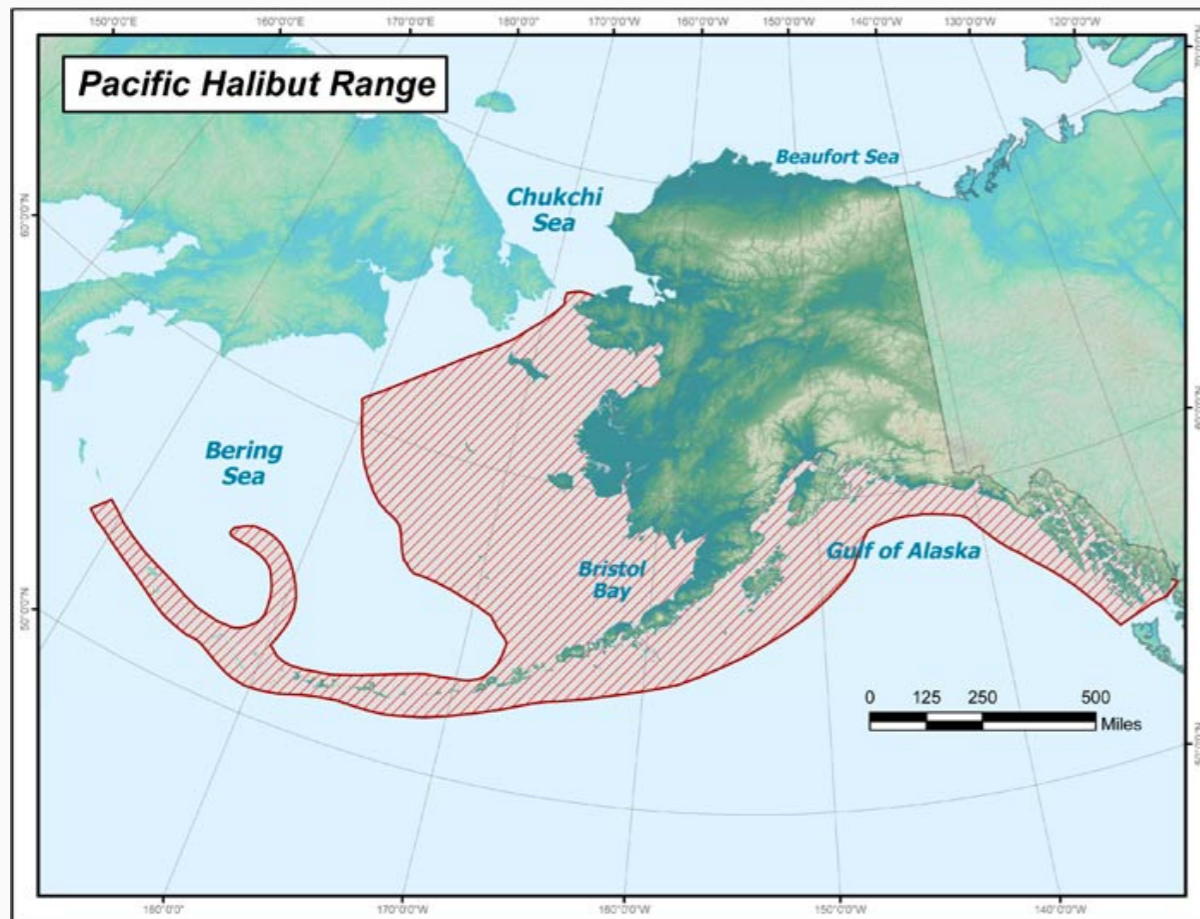

1. Learn a model of fish hatchery behavior
2. Simulate into the future what happens when making certain policy decisions

Idea: If RL can solve Mario and Go, it ought to be able to solve other problems in the real world of similar difficulty.

# The Pacific Halibut

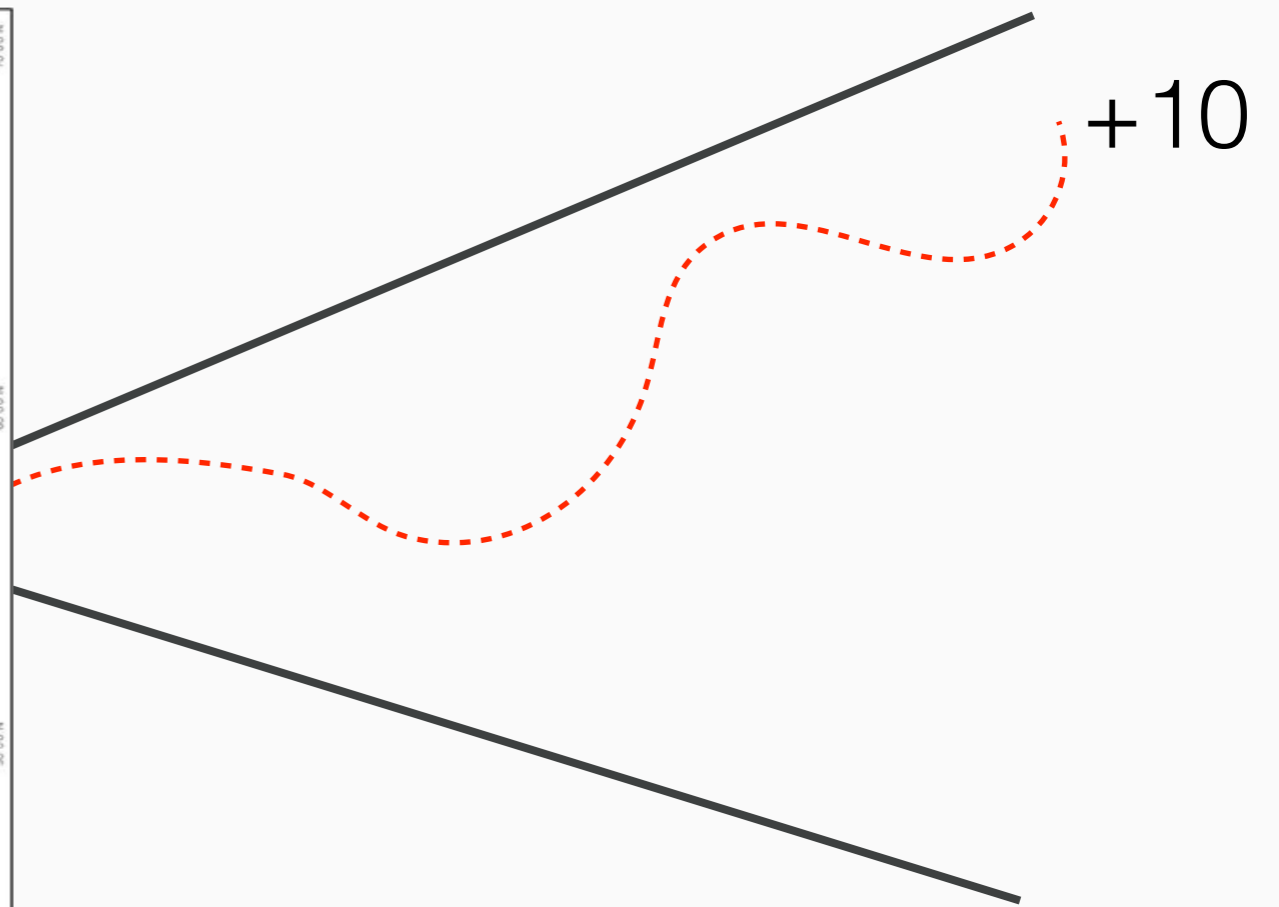

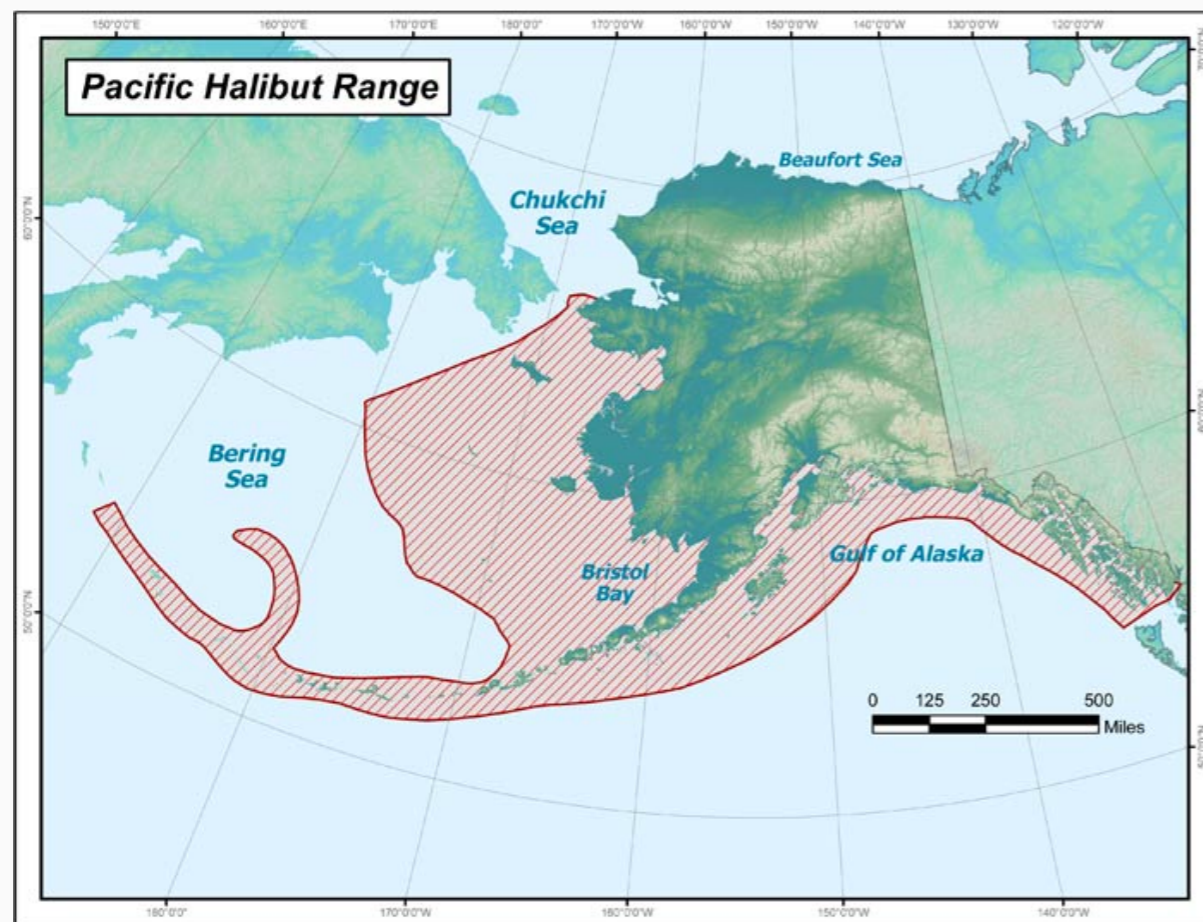

1. Learn a model of fish hatchery behavior
2. Simulate into the future what happens when making certain policy decisions
3. Find the strategy that maximizes reward

Idea: If RL can solve Mario and Go, it ought to be able to solve other problems in the real world of similar difficulty.

# 4. Computational Neuroscience

# Vision

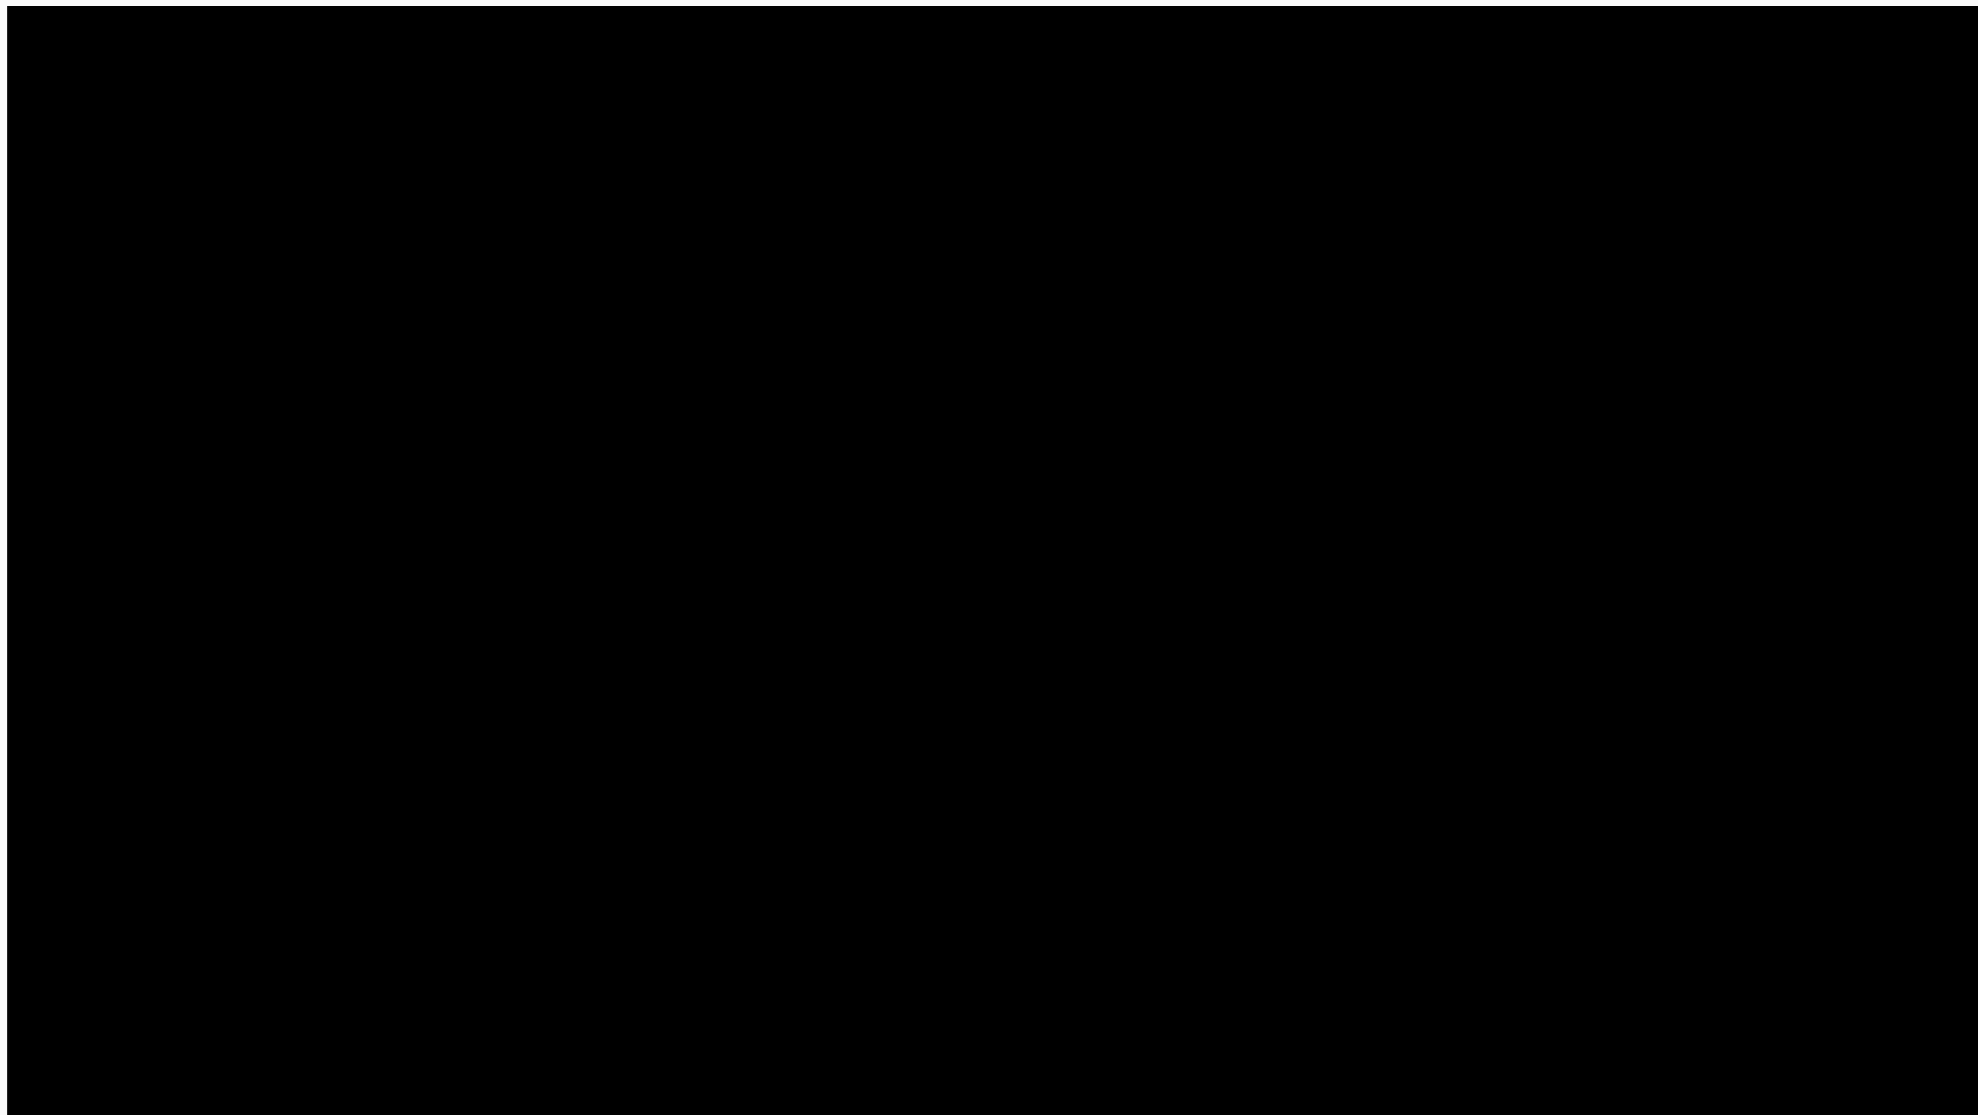

# Diagnosing Alzheimers

[Rudzicz et. al 2015]

# Brain Computer Interfaces

# Brain Computer Interfaces

## **A Lower Limb Exoskeleton Control based on Steady State Visual Evoked Potential**

No-Sang Kwak<sup>1</sup>, Klaus-Robert Müller<sup>1,2</sup> and Seong-Whan Lee<sup>1</sup>

<sup>1</sup> Department of Brain and Cognitive Engineering, Korea University

<sup>2</sup> Machine Learning Group, TU Berlin

# And Many More!

- Computational Evolutionary Biology
- Biological Computation (use DNA to compute!)
- Computational Pharmacology, Drug Discovery
- Computational Epidemiology
- ... the list goes on!
